cleat³ (klét), *v. t.* [*< cleat*², *n.*] To strengthen with a cleat or cleats.

cleat⁴ (klét), *n.* [Origin obscure.] In *coal-mining*, the principal set of cleavage-planes by which the coal is divided. Bituminous coal is more or less distinctly stratified—that is, divided by planes parallel to the bedding of the rocks above and beneath it. It is also almost always divided into thin layers by two sets of joint-planes nearly at right angles to each other and to the bedding. Of these two sets one is usually more distinct and this is called the *cleat*. The surfaces exposed in mining on the line of this cleat, which are in reality joint-planes of the coal, are called *faces* and *backs*. Called in England *cleat*.

2. In *mineral.*, the property possessed by many crystallized minerals of breaking readily in one or more directions, by which means surfaces more or less smooth are obtained. The cleavage shows the direction in which the force of cohesion is least. (Compare *parting*.) It is defined as *perfect* or *imperfect*, *interrupted*, etc., according to the ease with which the fracture takes place, and the smoothness of the resulting surface; also *cubic*, *octahedral*, *rhombohedral*, *prismatic*, *basal*, etc., according to the direction of the fracture.

3. In *geol.*, the property possessed by certain rocks of being easily split or divided into thin layers. It is chiefly the argillaceous rocks in which cleavage is highly developed, and it seems to be the result of metamorphism combined with pressure. The cleavage of roofing-slate is the best illustration of this structure. (See *clay slate*, under *clay*.) Some rocks split into thin layers as a result of stratification, but this is not what is properly understood by cleavage. Tyndall has shown that wax may have planes of cleavage developed in it by pressure; but the only rocks in which cleavage planes exist in perfection are those which have also undergone some metamorphism. See *metamorphism*.

4. In *embryol.*, segmentation, specifically of the vitellus: distinctively called *egg-cleavage* or *yolk-cleavage*. See *segmentation*. — **Cleavage-cavity**, in *embryol.*, the cavity segmentarium or hollow of a segmented vitellus or yolk which has become a vesicular morula; the interior of a blastula; the cavity of a blastosphere; a blastocoele or blastoceloma. — **Cleavage-globule, cleavage-cell**, a blastomere (which see). — **Cleavage-mass**, in *embryol.*, any cell resulting from the segmentation of the vitellus or yolk of a germinating ovum-cell; a morula-cell.

The first step in the development of the embryo is the division of the vitelline substance into cleavage-masses.

Huxley, Anat. Vert., p. 10.

"Suction-stops" are formed . . . by placing the tongue or lips in the position for a stop, and then sucking out the air between the organs which form the stop: they are thus pressed strongly together by the pressure of the air in the mouth, so that when separated a distinct snuck is heard. Foreigners in Rome, and even allied or subject states and cities, were often clients of Roman patricians selected by them as patrons. The number of a patrician's clients, as of a baron's vassals in the middle ages, was a gage of his greatness.

The institution by which every plebeian was allowed to choose any patrician for his patron . . . made the patricians emulate each other in acts of civility and humanity to their clients, and contributed to preserve the peace and harmony of Rome. *J. Adams, Works, IV. 543.*

The *climates* delicate; the air most sweet.

Shak., W. T., iii. 1.

This talent of moving the passions cannot be of any great use in the northern *climates*.

Swift.

As used by the Greeks, the word *κλίμα* denoted properly a slope or an incline, and was applied to mountain-slopes (*καταμακρὰ ὄρη*), but especially to the apparent slope or inclination of the earth toward the pole. Hence the word came gradually to be used as nearly the equivalent of *zone* (but not of the divisions of the earth's surface now so named). A change of "climate" took place, in going north, or arriving at a place where the day was half an hour longer or shorter, according to the season, than at the point from which the start was made. The same was the meaning of the word *climate* as used by the early English navigators (see def. 1). Gradually the change of temperature consequent on moving north or south came to be considered of more importance than the length of the day. Hence the word *climate* came finally to have the meaning now attached to it. **Continental climate.** See *continental*.

[NL.] In *entom.*, properly, that part of the upper surface of an insect's head which lies before the front or forehead, and behind the labrum when the latter is present; a fixed sclerite immediately in front of the epicranium, and to which the labrum is attached. See *cut* under *Hymenoptera*. By Huxley and other anatomists the front is included in this term, being distinguished as the *clypeus superior*, or *supraclypeus*. Some of the older entomologists, notably Fabricius and Liger, applied the term *clypeus* to the labrum. In *Diptera* it is probably represented by the part called the hypostoma or face; but in that order the name is applied to a more or less horny fold on the upper part of the membrane connecting the proboscis with the border of the mouth, properly answering to the labrum. In the *Heteroptera* the clypeus is a process of the upper part of the head or crown, which in some species extends over the face. Often called the *epistoma*, especially when it is small or softer than the surrounding parts; also *nasus* and *prælabrum*.

F. houille, Walloon hoie, ML. huller, mineral coal; Gr. ἀνθράξ, a burning coal, also mineral coal (see *anthracite*), L. carbo(n-), a burning coal, charcoal, in mod. use mineral coal (see *carbon*).]* 1. 2. A solid and more or less distinctly stratified mineral, varying in color from dark-brown to black, brittle, combustible, and used as a fuel, not fusible without decomposition, and very insoluble. It is the result of the transformation of organic matter, and is distinguished by its fossil origin from charcoal (dec. 1), which is obtained by the direct carbonization of wood. (See *coal-plant*.) Coal always contains more or less earthy matter, which is left behind in the form of ash after combustion. The quantity of the ash varies considerably, but in good coal does not usually exceed from 5 to 10 per cent. in weight. Coal can, however, be used for fuel, in default of a better material, when the amount of ash is much larger than this. Coal consists essentially of carbon, together with hydrogen, oxygen, and nitrogen; and sulphur is rarely if ever absent. The most general subdivision of coal is into *hard* and *soft*. The former is that coal which consists almost entirely of carbon; the latter is that in which there is a considerable percentage of hydrogen. Hard coal is generally called *anthracite*; bituminous coal, or simply *coal*, is the designation of the ordinary soft coal almost everywhere in general use where coal is burned, except in the eastern and Atlantic United States. In anthracite the bituminous or volatile matter constitutes usually less than 7 per cent. of the whole; in soft or bituminous coal it is usually more than 15 per cent. Coal intermediate in character between anthracite and bituminous coal is called *semi-anthracite* or *semi-bituminous*, according as it approaches anthracite or bituminous coal more nearly in character. The material driven off from coal on ignition is not really bitumen, for coal is fusible, while bitumen is soluble. The name comes from the fact that bituminous coal behaves on being heated very much as bitumen itself does—that is, it swells up more or less, fuses together, and burns with a bright flame and considerable dense smoke. Coal occurs in all the geological formations, from the lowest in which land-plants have been found (the Devonian) up to the highest; but the coal of the great manufacturing countries, England, France, Germany, and the eastern United States, is nearly all of the same geological age, and is obtained from the formation called the *Carboniferous*. (See *Carboniferous*.) The coal of Australia, India, and a part of that of China is of later geological age than the Carboniferous, being Mesozoic, and not Paleozoic. There is also a large quantity of good coal in various parts of the world in formations even more recent than the Mesozoic. In general, however, from the time of the Carboniferous on, the conditions

were continually growing less favorable for the formation of coal on a large scale; so that each successive age has less coal to show, and that on an average of poorer quality than the coal of the true Carboniferous epoch. (See *Carboniferous*.) Also called *stone coal*, *mineral coal*, and formerly *sea-coal*. [Coal in this sense is used as a collective noun without a plural; but in Great Britain the plural form is also used in speaking of a quantity of coal, with reference to the pieces composing it: as, to lay in a supply of coals; put more coals on the fire.]

It is also called *Torbane Hill mineral* and *torbane*.—**Bovey coal**, a Tertiary lignite or brown coal, occurring in beds from 2 to 16 feet thick, in pipe clay, at Bovey Tracey in Devonshire, England. It is an inflammable fossil, resembling in many of its properties bituminous coal. Its structure is fissile, and its cross-fracture even or conchoidal, with a resinous and somewhat shining luster. It is brittle, burns with a weak flame, and exhalates an odor which is generally disagreeable. —**Buckwheat coal**. See *buckwheat*.—**Coal-boring bit**. See *bit*.—**Delve of coals**. See *delve*.—**Fibrous coal**. Same as *mother-of-coal* (which see, below).—**Mother-of-coal**, a soft black substance, resembling charcoal in appearance, found in connection with coal, usually along its planes of stratification or lamination, in which the woody character of the material from which the coal was formed is more perfectly preserved than it is in the body of the coal itself. Also called *fibrous coal*, *fossil charcoal*, and *mineral charcoal*.—**Small coal**. (a) Little wood coals formerly used to light fires. *Gay*. (b) Same as *slack*.—**To blow a coal**, to kindle strife.

coal-plant (kôl'plant), *n.* A more or less distinctly preserved or fossilized relic of vegetation found in connection with mineral coal, and regarded as representing, or as akin with, the vegetation of which the coal itself is composed. The vegetable remains which are in the best preservation and have been most studied occur chiefly in the strata between which the beds of coal are intercalated, and especially in the under-clay or clupeh by which a large proportion of them are underlain. The shaly strata overlying the coal are also very frequently found to be crowded

with well-preserved forms of vegetable life. The vegetation accompanying coal varies with its geological age. (See *coal*.) As the Paleozoic or "Carboniferous" coal is in Europe and the eastern United States, at least—much more important than that of any other geological age, it is this coal-vegetation which has been the object of the most careful investigation. While it is generally admitted that the coal itself has been formed from the aggregation and more or less complete decomposition of vegetable matter, it is often very difficult to prove this, except by microscopic examination, after preliminary chemical treatment by which most of the entirely disorganized portion of the coal has been removed. Among the materials of which the coal of different regions has been shown by various authorities to be made up are: bark of *Calamites*, *Lepidodendron*, and *Sigillaria*, spores of *Lepidodendron*, vascular portions of *Psaronius* and other ferns, and leaves and bark of *Cordaites*. (See these words.) Vegetation of a higher order than the *Conferva* has not yet been proved to exist in connection with coal of Carboniferous age; by far the larger portion of the fossil plants of that epoch belongs to the *Cryptogamia*.

Among these products may be named paraffin, naphthalin, benzol, creasote, anthracene, carbolic acid, naphthalene, pitch, etc. The basic oil of coal-tar is the most abundant source of the beautiful aniline colors, their various hues being due to the oxidation of aniline by means of acids, etc. (See *aniline*.) Coal-tar is made into asphalt for pavements, and with coal-dust forms by pressure an excellent artificial fuel. It is largely used, by itself and combined with other substances, to form preservative compositions for coating wood and metal. It closely resembles nickel, the atomic weights of the two metals being the same, and their specific gravities nearly or quite the same. They have also very nearly the same ductility and tenacity, are almost always found in intimate association, and have in many respects a marked resemblance to iron, but are less fusible than that metal, and much less magnetic. Cobalt might be, and is to a very small extent, used for the same purposes for which nickel is used, especially for plating the surface of iron; but it is much rarer than nickel, is procured with more difficulty in the metallic form, and is consequently a dearer metal. The most important ores of cobalt are *cobaltite*, *amalgite*, and *linnecite*. (See these words.) Cobalt ores occur in a considerable number of localities, but nowhere in large quantity. The

chief supply of the cobalt preparations comes from Saxony, Bohemia, Hesse, and Norway. By far the greater part of the estimated annual product of 40,000,000 pounds is consumed at home. It is a stimulant, bearing some resemblance in its effects to tea and coffee, and has long been used as a masticatory by the Indians of South America. It relieves feelings of fatigue and hunger, and the difficulty in breathing experienced in climbing high mountains. The habit of chewing *coca* is an enslaving one. *Coca* is used in medicine as a stimulant and tonic; it yields the valuable alkaloid cocaine. Sometimes written *coca*.

cochin (kō'chin), *n.* [*< Cochinchina*.] A variety of the domestic hen, of large size, belonging to the Asiatic class, or a specimen of this variety. There are *black*, *buff*, *cuckoo*, and *white* *cochins*, both cock and hen of each kind being of the uniform color denoted by the adjective, except that the buff cock should show a richer shade of yellow or orange in hackle, saddle, and wing-bow. The *pure* *cochin* is either single or pea-combed, the *cochin* being similar in coloring to a black-breasted red game-cock, except that the hackle and the saddle-feathers should be striped with glossy black, and the hen being of a rich reddish or golden brown color, each feather distinctly pencilled with dark brown or black. The hackle of the hen is orange, striped with black, her tail black, and the wing-primitives are dark brown or black. All the *cochins* have heavily feathered legs and short tails, and all have the legs yellow, except the black *cochin*, which have them black or nearly so.

cochin-china (kō'chin-chī'nā), *n.* and *a.* A term formerly applied to a large kind of domestic hen which was imported from Cochinchina. From these fowls, which had no constant characteristics of color, form, etc., have been bred the varieties called *brahma* and *cochin*.

cochineal (kōch'i-nēl or kōch-i-nēl'), *n.* [Early mod. E. also *cuteaneal*; = D. *konzent* = G. Dan. *cochenilla* = Sw. *kochenill* = F. *cochenille* = It. *cochiniglia* = Pg. *coccinella*, *< Sp. cochinilla*, *cochinilla*, *< L. coccineus*, *coccineus*, scarlet, *< coccum*, *< Gr. κόκκος*, a berry, esp. the kermes insect (supposed to be a berry): see *coccus*. The *Sp. cochinilla*, *cochineal*, is by some referred to *cochinilla*, a wood-louse (to which the cochineal-insect has some resemblance), dim. of *cuchina*, a sow, fem. of *cuchino*, a pig; cf. E. dial. *sow-bug*, wood-louse.] 1. A dyestuff consisting of the dried bodies of a species of insects, the *Coccus cacti*, found upon several species of *Opuntia* and other *Cactaceae*, especially *O. tuna*, *O. ficus-indica*, and *Nopalea cochinillifera*. It colors a brilliant crimson, which is changed by acids to an orange-red and by alkalis to violet; a brilliant scarlet dye is prepared from it. The cacti upon which the insect lives, bearing the general name of *nopal*, are extensively cultivated as food for them in the tropical countries of America; and in Java, Algeria, etc. The females only are valuable for their col-

or, and are collected twice a year, after they have been fecundated and have laid eggs sufficient for a new brood. They are killed by spreading them upon heated plates, by putting them in ovens, or by immersing them in boiling water or exposing them to its vapor. Those killed by heated plates are of a blackish color, and are considered to be the finest; they are called *zacailla*. Those from ovens are next in value; they are of an ash-gray (blanco or silver-white) color, and are called *silver cochineal*, or *japradia*. Those killed by water or vapor are of a reddish-brown color, and are the least valuable. The fragments, dust, and impurities from cochineal are collected and used as an adulterant, under the name of *granilla*. The finest grade often goes by the name of *mexican* or *mexicana*, and is exported in large quantities from Honduras. Besides the finer grades, which are cultivated insects, a considerable trade is carried on in inferior or wild *cochineal*; they are scarcely more than half the size of the cultivated species, and are covered with a cottony down which adds a useless bulk. Good cochineal has the appearance of small, deep brownish-red, somewhat purplish grains, wrinkled across the back with parallel furrows, intersected in the middle by a longitudinal one. The coloring principle obtained from cochineal is carmalum acid. (See *carmin*, 3.) East Indian *cochineal*, so called, are smooth, glistening black grains, of no value; they are used to adulterate the genuine, which are easily distinguishable from them.

2. The insect which produces the dyestuff known by the same name. See def. 1.—**Cochineal fig.** See *fig.*—**Cochineal paste.** See *extract*.

Cochineal paste is obtained by placing 10 lbs. of Honduras cochineal in a vessel, and adding 30 lbs. of ammonia water (7° B.), stirring the mixture well. The vessel should be covered with a cloth, and allowed to stand for a few days. The vessel is then to be immersed in boiling water, in order to evaporate the superfluous ammonia; when the evaporation is complete the mixture is ready to be used (for dyeing). W. Crocker, Dyeing and Calico-printing, p. 88.

cochlea (kok'lē-ā), *n.*; pl. *cochleae* (-ē). [ML. (NL.), *< L. cochlea*, *cochlea*, a snail, a snail's shell, *< Gr. κοχλίας*, a snail, etc., *< κοχλός*, a shell-fish with a spiral shell; prob. akin to *κόχλιν*, *L. concha*, a conch, and ult. to E. *cockle*.] 1. A winding staircase. E. Phillips.—2. In *anat.*, a part of the inner ear in most vertebrate animals. Its shape in man and most other mammals resembles a snail-shell; hence the name. In the petrous bone a canal winds about a central conical pillar of bone, the modiolus, and contains a hollow process of the membranous labyrinth; the latter follows the turns of the canal nearly to the top. To these structures taken together the name of *cochlea* is given. The process of the membranous labyrinth is triangular in cross-section, with its base applied to the outer wall of the canal and the apex attached to a spiral crest of bone, the lamina spiralis ossea, projecting from the inner side of the canal. It thus separates the bony canal into two portions, in addition to its own lumen, the scala vestibuli above and the scala tympani below. The lumen of the process itself is called the canalis cochlearis, its floor is called the basilar membrane, and its roof the membrane of Reissner. Its cavity is connected with the semicircular by the canalis reuniens. The essential structures of the cochlea, the rods of Corti and the hair-cells, are on the upper side of the basilar membrane, and to them is distributed the cochlear branch of the auditory nerve. By Cuvier and Valenciennes it was named *Lates nobilis*, and by that name it was known to most naturalists up to 1860. It is ranked by some naturalists as a fresh-water fish, and occurs in all the large rivers of India and Burma. It is predatory in its habits, and ascends far up the rivers, especially in the wake of shoals of a kind of shad, *Clupea palasah*, and reaches as high as Mandalay, in Upper Burma, about 650 miles from the sea.

Pg. *coco*, a word used to frighten children, a bugbear, is prob. accidental. The spelling *cocoa* is due to confusion with *cacao*, which is also spelled *cocao*: see *cocoa*.] A palm belonging to the genus *Cocos*, producing the cocoanut.

C. nucifera is everywhere cultivated in tropical regions, but more especially on islands or near the sea. It has a cylindrical stem rising to a height of 80 to 90 feet, and surmounted by a crown of feathery leaves from 18 to 20 feet long. The small white flowers grow on a branching spadix, enclosed in a hard tough spathe. The fruits, called *cocoanuts*, are in bunches of from 12 to 20, and are of a subtriangular ovoid form, 12 inches long by 6 broad. They have each a single seed enclosed in a very hard shell, and surrounded by a thick fibrous rind or husk. This fiber, called *coco*, is made into cordage, matting, brushes, bags, etc. The flesh or meat of the cocoanut is a white pleasant-tasting mass, soft and gelatinous when young, but afterward lining the shell in a thick close layer; it is largely used as a condiment and in cookery and confectionery, and yields the valuable cocoanut oil (which see). The nut also contains when fresh from one to two pints of a clear pleasant liquid called the *milk*. The mature shell takes a high polish, and is made into drinking-cups and other utensils and ornaments. Its various uses make the cocoanut an important article of commerce. A spirit called *toddy* or *arack* is made from the sweet juice of the spathe. Indeed, almost every part of the tree is employed in tropical countries for some useful purpose. The heart, which is seldom found, is of a light yellowish-brown color, which changes to a deep brown, almost black. The firm part of the trunk is the so-called *porcupine-wood*, which is very hard and durable, and is much used for all kinds of turnery, and especially for inlaying. Also called *cocoa-tree*, *cocoanut-tree*.

But of greater admiration is the *Copra*-tree, being the most profitable tree in the world, of which in the Islands of Malacca they make and furnish whole ships.

Sir J. E. Tennent, Ceylon, vii. 2.

Cocoanut matting. See *matting*.—Double *cocoanut*, or *coco-de-mer*, the fruit of a remarkable palm, *Lobelia* *Sechellarum*, found native only on the Seychelles, in the Indian ocean, and growing to a height of from 50 to 100 feet, with a crown of gigantic palmate leaves. The fruit often weighs 40 or 50 pounds, and usually contains a nuts, which are 18 inches long, lobed at each end. Before maturing the inside of the nut is soft and eatable. The hard black shell is carved into ornaments, the young leaves yield an admirable material for baskets and plaited work, and the older leaves are used for partitions and thatching. The nuts, driven across the sea by the monsoons, were known in India long before the discovery of the tree which produced them, and wonderful stories were current respecting their origin. —See *cocoanut*, of Jamaica, the fruit of a species of *Manihara*, a palm of Trinidad and the South American coast, often washed ashore upon that island.

cocoanut-crab (kō' kō-nut-krah), *n.* A crustacean, *Birgus latro*, related to the hermit-crabs, inhabiting certain islands of the East Indian archipelago and Pacific ocean. It lives in deep burrows and is diurnal in habit.

It is prepared by the natives of the tropics, where the fruit abounds, both by decoction and by expression, and is used for lighting, the preparation of unguents, etc. It is exported to a considerable extent, and is also manufactured in Europe and the United States from cocoanuts or from copra, by expression or by treatment with sulphur of carbon. Chemically, it consists of a peculiar substance, *cocuin*, with a small quantity of olein. By saponification *cocuin* yields glycerin and *cocinic acid*. The oil is white, of the consistence of lard, and has a texture somewhat foliated. It is largely used in the preparation of candles and these called *fulling-soaps*. Also called *cocua-oil*.

Its action is such as to give high velocities to the projectile with low or moderate pressures in the bore. The name is derived from its resemblance in color to *cocoa* or chocolate. far south as Gibraltar. The principal cod-fisheries are on the banks of Newfoundland and the coasts of New England, but very valuable ones also exist on the coasts of Norway. It is a very voracious fish, living in water from 25 to 40 fathoms deep, where it always lies close to the bottom, and will take almost any kind of bait which may be offered. The cod reaches maturity at the end of the third year, when it usually measures about 3 feet in length and weighs from 12 to 20 pounds; individuals, however, have been taken weighing from 50 to more than 100 pounds. The cod is of great commercial importance both as a food-fish and as the source of cod-liver oil, which possesses nutritive and therapeutic qualities of much value. Some variations in the size or quality of cod are indicated by terms expressive of the location in which they are taken, as *deep-water* or *shallow-water cod*, *shore* or *inshore cod*, etc. The name is also extended, as a popular family term equivalent to *Gadidae*, to all the species, and in different English-speaking countries is misapplied to various species of *Scorpena*, *Chiridia*, *Serranidae*, *Sparidae*, *Percepheididae*, and *Ophidiidae*.

The copy of the Gothic Bible known as the *Codex Argenteus* (silver manuscript) from its silver letters (initials and divine names in gold), formerly at Werden in Westphalia, now at Upsala in Sweden, is noted both for this peculiarity and as being the most important of the few extant remains of the Gothic language. Among secular books, one of the most celebrated is the *Codex Ambrosianus* of the Lind, containing 58 pictures, of all existing manuscript illustrations retaining most of the character of good antique art.

Till the 8th century, when it fell altogether into disuse, the Estrangelo continued to be employed for uncial manuscripts and ornate codices.

Both those who affirm and those who deny the expediency of codifying the English law, visibly speak of *Codification* in two different senses. This general cavity is known as an enterocoele, in distinction from an intestinal canal proper. The walls of the body are substantially composed of two layers, an inner or endoderm, and an outer or ectoderm. There are no traces of a nervous system, except in certain medusae, and there is no proper blood-vascular system. Peculiar stinging-organs, thread-cells, cubile, or nematocytes are very generally present (in all the *Cnidaria* or ctenophores proper), and in most cases the arrangement of parts or organs is radially, as is especially observable in the disposition of tentacles around the mouth. Reproduction is usually sexual, distinct generative organs being present, and ova and spermatozoa being discharged by the mouth; but multiplication also takes place by budding and fission. The *Oolentera* proper, or *Cnidaria*, are divided into the two great classes of *Actinozoa* and *Hydrozoa*, including all the sea-anemones, corals, scaphophytes, medusae, etc. In a wider sense, the sponges and ctenophores are also included.

The berry of trees belonging to the genus *Coffea*, natural order Rubiaceae. Several species, but principally *C. Arabica*, produce the coffee of commerce. It is a native of Arabia and Abyssinia, but is now extensively cultivated throughout tropical countries. It will grow to the height of 16 or 18 feet, but is seldom permitted to exceed 8 or 9 feet, for the convenience of gathering the fruit. The stem is upright, and covered with a light-brown bark; the branches are horizontal and opposite. The flowers grow in clusters at the bases of the leaves, are pure white, and of an agreeable odor. The fruit is a small, round, fleshy berry, having the size and appearance of a small cherry. Each berry contains two seeds, commonly called *coffee-beans* or *café-nibs*. When ripe the berries are gathered, and the outer pulp and the parchment-like covering of the seeds are removed. The Mocha coffee from Yemen in Arabia is reputed the best; but the principal supplies are now obtained from Ceylon, Java, the West Indies, Brazil, and Central America. The Liberian coffee-tree, *C. Liberia*, of western tropical Africa, has recently

been introduced into cultivation. It grows to a greater size and yields a much larger berry than *C. Arabica*, and thrives in low damp regions where the latter will not flourish. What is known as the *male coffee-berry* is simply a re-

The act or state of cohering, uniting, or sticking together; specifically, in phys., the state in which, or the force by which, the molecules of the same material are bound together, so as to form a continuous homogeneous mass. This force acts sensibly at insensible distances—that is, when the particles of matter which it unites are placed in apparent contact. At insensible distances it is a much greater, at sensible distances a much smaller, force than gravitation, so that it does not follow the law of variation of the latter. It unites the particles of a homogeneous body, and is thus distinguished from adhesion, which takes place between the molecules of different masses or substances, as between fluids and solids, and from chemical attraction, which unites the atoms of a molecule together. The power of cohesion in a body is sustained by the force necessary to pull its parts asunder. In general, cohesion is most powerful among the particles of solid bodies, weaker among those of fluids, and least of all, or entirely wanting, in elastic fluids, as air and gases. Hardness, softness, tenacity, elasticity, malleability, ductility, and in crystallized bodies cleavage, are to be considered properties dependent upon cohesion. The most powerful influence which tends to diminish cohesion is heat, as shown in the change of a solid to a liquid, or of a liquid to a gas, which is effected by it. See *gas* and *liquid*.

2. In bot., the congenital union of one part with another. If the parts are similar, as two stamens, their union is specifically called *coalescence*; if dissimilar, as calyx and ovary, it is styled *adnatum*.

3. Connection; dependence; affinity; coherence. [Now rare in this sense.]

Ideas that have no natural cohesion. *Locke*.

The greatest strength of that prevailing Faction [the Romish religion] lies in the close union and cohesion of all the parts together. *Stillingfleet, Sermons*, II, i.

Cohesion figures, a class of figures produced by the attraction of liquids for other liquids or solids with which they are in contact, and divided into *surface, submergence, breath, and electric cohesion figures*. It was found by C. Tomlinson, an English physicist, that a drop of liquid, as of oil or alcohol, spreads itself out on the surface of water always in a definite figure, the figure differing with each fluid dropped on the water; and he suggested that this might be employed as a test for oils, etc. The same principle holds true with regard to liquids which, from greater specific gravity, sink slowly to the bottom in water, each liquid submerged forming a definite figure peculiar to itself. *Breath figures* are produced by putting a drop of the liquid to be examined on a slip of mica and breathing on it, when again each fluid takes a distinct characteristic shape. *Electric cohesion figures* are produced by electrifying drops of various liquids placed on a plate of glass.

Magnetic cohesion, that power by which two magnetic bodies adhere together, as iron to a piece of lodestone.

Bronze Coinage Act, an English statute of 1830 (22 and 23 Vict., c. 30), making the coinage laws applicable to bronze or mixed metal coins.—**Coinage ratio**, the ratio which expresses the equivalence in value between gold and silver under the (then existing) mint law. Thus, in the United States, under the law of 1837, it is 15.988 to 1; that is, one pound of gold can be coined into as many dollars as 15.988 pounds of silver. The coinage ratio is intended (except for subsidiary coins), where bimetallicism is desired, to be identical with the average commercial ratio; if this is not the case the metal which is undervalued disappears from circulation as money. Thus under the law of 1792 the coinage ratio was fixed at 15 to 1, but this undervalued gold and it disappeared from circulation; in 1834 the ratio was changed to 16.002 to 1, and in 1857 to 15.988 to 1, but this undervalued silver and it practically disappeared from circulation (except in the form of subsidiary and abraded coins) until 1873, when it was demonetized. Since that date the fall in the value of silver has brought the commercial ratio (1896) down to about 32 to 1. See *Free coinage*. See *free*.—**Garbling the coinage.** See *garble*.

cokeatrice, *n.* An obsolete form of *cokeatrice*. **coke** (kōk), *n.* [*Sometimes spelled coak; same as E. dial. coaks, coaks, cinders. Cf. grindle-coke, a worn-down grindstone. Phonetically, coke may be compared with cake (cf. Lat. kake, cake, and see cake); but coke does not "cake."* Hence *F. coke, Sp. coque, G. koaks, kohks, usually coaks, etc., coke.*] The solid product of the carbonization of coal, bearing the same relation to that substance that charcoal does to wood. It is an important article in metallurgy, since for bituminous coals can be used for the manufacture of iron without having been first coked. The *coking coals* as they are called, are bituminous, and such as contain but a small percentage of water. Hence the coals as we get at the Tertiary—brown coals or lignites—rarely furnish coke; that is, the material left behind after the bituminous or volatile matter has been driven off is a powder, and not the coherent somewhat vesicular substance to which the name of *coke* is given. The nature of the difference between coking and non-coking coals has not yet been fully made out, and it is stated on good authority that some coal which cokes readily when first mined does not do so after having been exposed to the atmosphere. It only for a few days. The use of coke dates certainly as far back as the middle of the seventeenth century. Its preparation was formerly known as *charking* or *charring*, and the word was often, and is still occasionally, written *coak*.

The essential features are a chamber to contain the coal, with openings at various points for the admission of air, which can be closed as required during the progress of the operation, and a furnace or fire chamber to supply the necessary heat. In the Roman Catholic, Anglican, and other Western liturgies: (a) A concise prayer, varying according to the day, week, octave, or season, recited before the epistle, regularly consisting of one sentence, and asking for some grace or blessing with reference to some teaching of the epistle or gospel, or both. A collect is composed of an address to the Trinity or to one of the Divine Persons, a petition thus introduced, and the pleading of Christ's merits or final ascription to a Person of the Trinity. One collect may be used alone or several in succession. Collects regularly belong to the eucharistic office, but are repeated in the day-offices (hours, morning and evening prayer), thus forming a constant link between the latter and the altar service. They are characteristic of Western liturgies and offices, not being known in the Eastern churches. Almost all those still in use are very ancient, and the origin of this form of prayer is at least as old as the fifth century. Leo the Great (440-61) and Gelasius I. (492-96) are reputed the first composers of collects. See *oratio*.

As used in current speech, and also in economics, no very definite line of distinction between communism and socialism can be drawn. Generally speaking, communism is a term for a system of common property, and this should be accepted as the reasonably correct usage of the word; but even by socialists it is frequently used as practically synonymous with socialism. *Collectivism* is a word which has recently come into vogue to express the economic basis of socialism as above explained.

Encyc. Brit., XXII, 207, note.

Collectivism, which is now used by German as well as by French writers, denotes the condition of a community when its affairs, especially its industry, are managed in the *collective* way, instead of the method of separate, individual effort. *Wodson, Communism and Socialism, p. 4.*

The Marxists insisted that the social regime of *collective* property and systematic co-operative production could not possibly be introduced, maintained, or regulated, except by means of an omnipotent and centralized political authority — call it the State, call it the *collectivity*, call it what you like — which should have the final disposal of every thing. *Rae, Contemp. Socialism, p. 140.*

4. *Collectivism*; especially, the ownership on the part of the state or the people at large of all means of production, especially of the soil.

Collectivity, in the dialect of the Socialists, means the ownership of all the instruments of production by the state, and its use of them in such manner as shall seem best calculated to eradicate or diminish poverty.

colloidion (kol-ō-dī-on), *n.* [NL., also *colloidium*, < Gr. *κόλλωδης*, like glue, < *κόλλα*, glue, + *ειδος*, semblance.] A substance prepared by dissolving pyroxylin, or gun cotton in ether, or in a mixture of ether and alcohol. It forms a useful substitute for adhesive plaster in the case of slight wounds. When the solution is applied to the wound, it immediately dries in a semi-transparent, tenacious film, which adheres firmly to the part, and protects the wound or abrasion. With the addition of a small quantity of iodides and bromides, colloidion is employed as the basis of a photographic process, called the *colloidion* or *act process*. To obtain a negative picture by this process, a glass plate is covered with a film of colloidion, which is sensitized by a salt (usually the nitrate) of silver, and the plate exposed in the camera. The latent image obtained is then developed by the application of a solution of iron protosulphate, water, and acetic acid, and the unprecipitated silver remaining in the film is dissolved by a fixing solution of sodium hyposulphite or of potassium cyanide. To obtain a positive picture, a sheet of paper is laid upon the face of the negative in a frame, the paper having been sensitized by floating on a solution of silver nitrate, or by any other of several methods. The frame is then exposed to light in such a manner that the rays, to reach the paper, must pass through the negative, and the exposure is continued till the tone is sufficiently deep, after which the tint is improved by means of gold chloride and other salts, and the picture fixed with sodium hyposulphite. Positive pictures may also be obtained direct by the colloidion process. Colloidion is used also as a water-proof coating in place of varnish, especially to protect leather matches from the effects of dampness.

It occurs in the thyroid gland, in certain tumors, and occasionally elsewhere. — **Colloid sphere**, a globule with an oily luster, the result of the colloid degeneration of a single cell. — **Colloid substance**, in *pathol.*, a clear jelly-like substance, firmer and more consistent than mucous substance, soluble in water, not precipitated by acetic acid, and not giving a color with iodine. It arises from colloid degeneration.

II. *n.* A substance in a peculiar state of aggregation characterized by slow diffusibility, permeability by crystalloid solutions, etc. See extract.

They are distinguished by the gelatinous character of their hydrates. Although often largely soluble in water, they are held in solution by a most feeble force. They appear singularly inert in the capacity of acids and bases, and in all the ordinary chemical relations. But, on the other hand, their peculiar physical aggregation, with the chemical indifference referred to, appears to be required in substances that can intervene in the organic processes of life. The plastic elements of the animal body are found in this class. As gelatine appears to be its type, it is proposed to designate substances of the class as *colloids*.

4. A mark of punctuation formed by two dots like periods placed one above the other (:), used to mark a discontinuity of grammatical construction greater than that indicated by the semicolon and less than that indicated by the period. The colon is commonly used (1) to emphasize a close connection in thought between two clauses of which each forms a complete sentence, and which might with grammatical propriety be separated by a period; (2) to separate a clause which is grammatically complete from a second which contains an illustration or amplification of its meaning; thus, in this work illustrative clauses introduced by "as" are separated from the definition by a colon; (3) to introduce a formal statement, an extract, a speech in a dialogue, etc. Originally it was the mark of the termination of the grammatical or paleographic division called by the same name, and it is now frequently used to mark off metrical periods in prose intended for chanting.

colon² (kō'lon), *n.*; pl. *colons* (-lonz), *cola* (-lī). [= D. *colon* = G. Dan. Sw. *kolon* = F. Sp. *colon* = It. *colón*, < L. *colōn*, *colūm* (prop. *colōm*, *colūm*), < Gr. *kōlon* (sometimes incorrectly written *kōlon* by confusion with *kōlon*, a member: see *colon*¹), the large intestine, also food, meat, fodder. Hence *colic*.] 1. In *anat.*, a portion of the intestinal tract, the so-called "large" as distinguished from the "small" intestine, continuous from the ileum to the rectum; the great gut, beginning at the caecum and ending in the sigmoid flexure. In man and mammals generally the colon is distinguished from the preceding small intestine by its greater caliber, and by its sacculated, due to the particular distribution of its circular muscular fibers, which constrict it at some places and allow it to bulge out at others, forming a series of pouch-like expansions. It may also present continuous bands of longitudinal fibers or lengthwise constrictions, so that the cross section is not circular. The colon may not be distinguishable in size or appearance from the rest of the intestine, as in birds, where its commencement is marked only by the presence of a caecum or of two caeca; and when these are wanting, there is no distinction. In man the course and situation of the colon are definite, owing to the binding of the gut in place by the mesocolon and gastrosplenic omentum. Beginning at the caecum and ascending by the right kidney, it passes under the concave surface of the liver and the bottom of the stomach to the spleen; thence descending by the left kidney, it passes in the form of an S to the upper part of the sacrum, where it becomes the rectum. The parts of the colon are designated according to their position or direction: as, the *right lumbar* or *ascending colon*; the *arch* of the colon, or *transverse colon*; the *left lumbar* or *descending colon*; and the sigmoid flexure, or *S* of the colon. See cuts under *alimentary* and *intestine*.

2. In *entom.*, the second portion of an insect's intestine, generally broader than the preceding portion or ileum. It may be straight or convoluted, terminating at the anal opening, or separated from it by a short rectum.

colonel (kér-nel or -nī; old pron. kōl-ō-nel'), *n.* [Orig. *coronel*, *coronell* (later also *coronall*), and then, after F., *colonel*, *colonell*, *collonell*; introduced from Sp. about 1548 (the date of the

first instance noted; see the first extract below); < Sp. *coronel* = Pg. *coronel* (> ML. *coronellus*) = It. *colonello* (> ML. *colonellus*, F. *colonel*, *colonell*, > D. *colonel*), a colonel, lit. the leader of the column or company at the head of the regiment, < *colonnello* (ML. *colonnellus*), the column at the head of a regiment, dim. of *colonna*, < L. *colūma*, a column: see *column*, and cf. *colonnade*. The change of *l* to *r* in the Sp. Pg. form is due to dissimilation, or perhaps to association with Sp. L. *corona*, Pg. *coroa*, a crown; cf. Sp. dim. *coronel*, a crown (in heraldry): see *coronall*. The E. word, orig. pron. as spelled, *cor-o-nel'*, *cor'o-nel'*, became, by regular phonetic change, *cor'n-el*, and now *cor'n-el* (kér-nel) (being often so spelled in novels and character sketches which seek to be realistic), retaining the *r* of its Sp. form; but the spelling was soon changed to suit the F. form, which was much more familiar to the eye of readers. Hence the later occasional pronunciations kōl-ō-nel', kōl'ō-nel'. The chief commander of a regiment of troops, whether infantry or cavalry, next in rank below that of a general officer—in the United States army, of a brigadier-general. In the British army, except in the artillery and engineers, the office of colonel is often honorary, and is generally conferred on distinguished officers and princes of the blood royal, the real command resting with the lieutenant-colonel in each battalion, who after five years of service becomes a colonel. Generals who have had what is called "a regiment given to them" as a reward for service, and virtually as a retirement, have the rank of colonel. In the Russian, German, and Austrian armies the colonel of each regiment, holding the title only as an honor, is usually a member of some princely or other eminent family, often foreign, and sometimes appointed in childhood. Often, as a title, abbreviated *Col*.

Hee was . . . coronell of the footmen, (though that term [was] in those days [1544] unused.)

Then did sir knight abandon dwelling,
And out he rode a-colonelling.

S. Butler, Hudibras, l. i. 11.

Colonel Bogie. In *golf*, an imaginary player, to whom is assigned, by the committee in charge, a score against which the players have to play.

This "Bogie" score usually represents par play over the green, and it is made known before the competition begins, so that each competitor knows what he has to do at every hole. Each player counts his score at every hole, and if he holes out at that particular hole in fewer strokes, or in the same number, or in more than the appointed number, he wins, halves, or loses the hole to "Bogie," as the case may be. At the end of the game the number of holes won from "Bogie" are placed against those lost to "Bogie," and the player who is the greatest number of holes up or the fewest down wins the competition.

colony (kol-ō-ni), *n.*; pl. *colonies* (-niz). [*Early

Sw. koloni*, < *F. colonie* = *Sp. Pg. It. colonia*, < *L.
colonia*, a colony, < *colonus*, a husbandman, colo-
nist, < *colere*, till, cultivate, dwell: see *cult*, *culti-
vate*, etc.] 1. A company or body of people who
migrate from their native country or home to a
new province, country, or district, to cultivate
and inhabit it, but remain subject to or inti-
mately connected with the parent state; also,
the descendants of such settlers so long as the
connection with the mother country is retained.
Among the ancient Greeks the simple colony, which was
not necessarily dependent upon the parent state except in
religious matters, must be distinguished from a *cleruchy*
(which see). Among the Romans the earliest colonies,
so called, were merely garrisons in a hostile territory.
Later, colonies were founded for the benefit of the poor
of Rome; but Sulla restored the military character to the
colony, which became in general a foundation for the
benefit of veteran soldiers who had served their time.
The colonists retained their Roman citizenship, and re-
ceived their lands by lot, the original inhabitants of the
site being subordinated to them. In American history
the name is given especially to the thirteen separate com-
munities along the Atlantic coast under English rule which
combined in the revolution, and were formed in 1776 into
the United States of America. They were (in geographi-
cal order) New Hampshire, Massachusetts, Rhode Island,
Connecticut, New York, New Jersey, Pennsylvania, Mary-
land, Delaware, Virginia, North Carolina, South Carolina,
and Georgia. These were all originally English colonies
excepting New York and Delaware, which were for a time
respectively Dutch (as New Netherland) and Swedish (as
New Sweden). Their governments were by charter (in Mas-
sachusetts, Rhode Island, and Connecticut), proprietary
(in Pennsylvania, Delaware, and Maryland), or royal
(in the remaining colonies). In each (except Rhode Island
and Connecticut, which chose their own governors) the
governor was appointed by the crown or by the proprie-
taries. The crown claimed a veto on legislation, and juris-
diction of appeals from the court of last resort.

Once on a time thirteen famous colonies of the older
England voted that they were and ought to be free and
independent states. By that vote they ceased, in the sense
of a colonial office, to be English colonies any longer. In
the sense of history they became English colonies more
truly than before. E. A. Freeman, *Amer. Lects.*, p. 25.

American colony in Paris.—4. A number of
animals or plants living or growing colonially.
Specifically—(a) In bot., a group of (generally unicellular)
fungi or algae produced by cell-division from a common
parent cell, and adhering in groups or chains, sometimes
held together by an enveloping gelatinous substance, each
individual being able to exist separately. (b) In zool., a
polyp-stock, polypidium, or some similar aggregate of in-
dividuals: applied to various actinozoans, hydrozoans, and
polyzoans, to the social or compound ascidians, etc. Thus,
a bit of living coral is a colony of coral polypites. See *coral*
under *Coralligena*.—**Crown colony**, a colony in which
the crown has the entire control of the legislation, while
the administration is carried on by public officers under
the control of the home government: distinguished from
colonies having a constitution and representative govern-
ment. Gibraltar and Hongkong are examples of British
crown colonies.—**Old Colony**, specifically, the Plymouth
Colony in Massachusetts, as the region once occupied by
it: so called from having been the earliest settlement
within the present limits of Massachusetts.

ering, from the root of *celare*, cover, hide, oc-
cultare, hide: see *conceal* and *occul*. For the
transfer of sense, cf. *Gr. χροά, χροα*, surface,
skin, color.] 1. Objectively, that quality of a
thing or appearance which is perceived by the
eye alone, independently of the form of the
thing; subjectively, a sensation, or the class of
sensations, peculiar to the organ of vision, and
arising from stimulation of the optic nerve. The
proper stimulus to the sensation of color is light radiated
from a luminous body or reflected from the surface of a
non-luminous body; but it can be induced by other means,
as by an electric shock. When a ray of white light is
analyzed, as by a prism, into parts each of a definite
wave-length, the parts show the colors red, orange, yellow,
green, blue, indigo, and violet, which form a continuous
spectrum, each color shading gradually into the next.
(See *light* and *spectrum*.) These colors have been termed
primary or *simple*, though in fact they do not excite sim-
ple color-sensations. If the colors of the spectrum are
recombined, white light reappears. Similarly, if two col-
ors which lie near together in the spectrum, both on
the same side of light of wave-length 0.524 micron, are
mixed (for example, if two rays of colored light are
thrown upon the same spot so as to be reflected from it
together), the intermediate colors are nearly produced.
If, however, the colors, being on different sides of that
point, are taken further and further apart in the spec-
trum, the mixture becomes gradually whiter (less satu-
rated) until two colors are found which produce pure
white light. If the colors are still further removed, a
purple results. Those pairs of colors which when mixed
produce white or gray light are called *complementary col-
ors*: such are red and green blue, orange and blue, yellow
and indigo-blue, green-yellow and violet. The sensations
produced by the different parts of the spectrum, however,
vary with the intensity of the light: thus, orange when
highly illuminated looks more yellow than when darker,
and the main effect of increasing the illumination of a
color is to add a yellow color-sensation, called the *color
of brightness*. If, instead of mixing spectral colors, col-
ored pigments are mixed, very different results are ob-
tained: thus, while spectral blue and yellow produce
white, blue and yellow pigments produce green. This is
due to the fact that the blue pigment absorbs nearly all
the yellow and red light, while the yellow pigment absorbs
the blue and violet light, so that only the green remains
to be reflected. Colors vary in *chroma*, or freedom from
admixture of white light; in *brightness* or *luminosity*;
and in *hue*, which roughly corresponds to the mean wave-
length of the light emitted. The numbers which measure
these quantities, as well as any other system of three num-
bers for defining colors, are called *constants of color*. Pure
white light and darkness are not ordinarily regarded as
colors; but white and black objects are commonly spoken
of as colored although the former reflect and the latter
absorb all the rays of light without separating them into
colors properly so called.

2. In painting: (a) The general effect of all
the hues entering into the composition of a
picture. (b) An effect of brilliancy combined
with harmony: said either of a work in differ-
ent colors or of a work in monochrome, or of
an engraving: as, the picture has no color; the
engraving is full of color.

Though there is no color, strictly speaking, in an en-
graving consisting merely of black and white lines, yet the
term is often . . . applied to an engraving which is supposed,
from the varied character of its lines and the contrast of
light and shade, to convey the idea of varied local colour
as seen in a painting. *Chatter*, *Wood Engraving*, p. 212.

3. Any distinguishing hue, or the condition of
having a distinguishing hue—that is, a hue dif-
ferent from that which prevails among objects

intentional discords, etc. The use of the term is
traceable to the early use of colored lines to assist in the
interpretation of the measure, and also of colored notes and
other signs in the mensural music. (b) The timbre or
quality of a musical tone. See *timbre*. Absorption
of color. See *absorption*.—Accidental colors,
acoustic color, adjective color. See the adjectives.

an apparent but not a sufficient right, the object being to
lay a foundation for matter in avoidance of it.—Color of
office, the semblance of right by which a sheriff or other
officer assumes to do that which the law does not really
authorize. It implies an illegal act.—Color of title,
semblance or appearance of title, irrespective of its val-
idity. According to the stricter authorities, to give color
to title the instrument should be good in form, identify
the property, profess to convey it, and be duly executed,
and in such case possession under it may then be perfect
title, irrespective of the void or voidable character
of the instrument. Confluent colors. See *confluent*.

Distemper colors, colors ground in water to a creamy
consistency, to which is added a sizing of glue or white
of egg to make them adhere to the surface to which they

medium to be used in painting. Ecclesiastical colors,
liturgical colors, colors for vestments, and for hangings
of the altar, sanctuary, pulpit, etc., varying according to
the festival, the season, or the kind of office. According
to the Roman sequence of colors, white, as the color of
purity and joy, is used on the festivals of Christ, the Vir-
gin, angels, and saints not martyrs, and at marriages; red,
as the color of blood, on the feasts of the Holy Cross and
of martyrs, and also of Whit-sundae with reference to the
tongues of fire (Acts ii. 3); violet or purple, as the peniten-
tial color, in Advent, Septuagesima, etc., Lent, and on Al-
gals, etc.; green, the prevailing color of natural vegetation,
and symbolic of hope, on days and during seasons not
otherwise distinguished, especially from Trinity to Advent
Sunday, both exclusive; black, on Good Friday, at funerals,
and at services for the departed. These colors are widely
used in Anglican churches also, though less frequently for
vestments than for hangings. Some Anglican churches
have revived the old English or Sarum colors, namely,
red as the ordinary Sunday color, as a penitential color
on Ash Wednesday, Good Friday, Easter Even, and Whit-
sun Even, and also on the same days as in the Roman use;
white, throughout East-tide; yellow, for feasts of con-
fessions; blue, indifferently with green; and brown or
gray with violet, for penitential seasons. In the Greek
Church vestments, etc., of various colors are used, but
there is no fixed or habitual sequence as in the West, ex-
cept that red is preferred for Lent. Fast colors, those
colors which do not wash out or fade easily from exposure
to the sun.

The name of fast colours is given to those which resist
the action of light, air, water, alcohol, dilute acids and
alkalis, and of weak hypochlorites and soap solution.

tints appearing in a picture. Gradation of color, the
continuous variation of the color-sensations excited by

hue which excites intensely chromatic color-sensations. (b)
Richness of the complexion. Intense color, a high color.

Japan colors, colors ground in a medium called japan.
They are used by coach- and car-painters, and are often
called *coach-colors*. They are thinned with turpentine
before using, and dry dead or flat, that is, without any
gloss. They are afterward varnished which brings out the
brilliance of color.—Law of color, the principle that
every color of the spectrum can be matched by a mixture
of some two out of three colors, namely, the scarlet vermil-
ion of the spectrum at wave-length 0.639 (Angstrom), the
pure blue of the spectrum at wave-length 0.464, and a
green a little more intense than the pure green of the spec-
trum at wave-length 0.521, except only that the green of
the spectrum contains a little of both red and blue.

Liturgical colors. See *ecclesiastical colors*, above.—
Local color. (a) In painting, the hue, or combination of
hues, special to any object or part. (b) A general system

ity; said of a place, a country, a period, etc.

ridge of masonry, they contribute to a positive jumble of
local color.

H. James, Jr., *Trans. Sketches*, p. 11.

Hence—(d) Analogous characteristics in a literary com-
position. Low color, a color of little chromatic intensity.

—Mixture of colors, a color which throws upon the ret-
ina a sum of lights similar in quantity, and proportionate
in intensity, to the lights which would be projected by the
constituent colors, the sum of the proportions being unity.
Thus, if A, B, and C are the lights thrown upon the retina
by three colors, and another color projects a light which is
the sum of $\frac{1}{2}$ A, $\frac{1}{3}$ B, and $\frac{1}{6}$ C, then the latter is said to be a
mixture of A, B, and C.—Moist color. See *water-color*,
below.—Neutral color, a color which matches a mixture
of white and black.—Oil-color, a pigment of any kind
ground in linseed or poppy-oil. The former oil is gener-
ally used for house-paints, the latter for artists' colors.

portion, however small, of African blood.

by no means rare.

accidents as affect neutral colors.—Primary colors. (a)
The seven colors into which Newton arbitrarily divided
the spectrum. See def. 1, above. (b) The colors red, yel-
low, and blue, from the mixture of which it was errone-
ously supposed (from the facts of the mechanical mixture
of pigments) all other colors could be produced. (c) The
red, green, and violet light of the spectrum, from the

mixture of which all other colors can be produced. Also
called *fundamental colors*.—Pulp-colors, the names given
by paper-stainers and calico-printers to colors ground in
water.—Pure color. (a) A color produced by homoge-
neous light. (b) Any very brilliant or decided color. (c)
In painting, color in which each hue is lighted or shaded
only with a modification of itself, and not with a totally
different hue. Thus, a brick wall painted in pure color
will be red in both sunlight and shadow, as distinguished from
a representation of such a wall as red in the sun, and blue,
gray, or brown in the shade.—Secondary colors. See
secondary.—Spirit colors, certain colors obtained in cal-
ico-printing, so called from the use of "spirits," the tech-
nical name for the acid solutions of tin, in applying the
colors. Also called *application colors*. Subjective col-
ors. Same as *accidental colors* (which see, under *acciden-
tal*).—Substantive color. See *adjective color*, under

They are soft, and form when applied a kind of glaze upon
the surface of the glass.—Vitrifiable colors, the oxides of
various metals ground to a paste in a medium, usually oil
of turpentine, and used for decorating pottery. The colors
are developed by being fused into the glaze at a high tem-
perature in a kiln.

Water-color. (a) A pigment ground
in water containing a small amount of glue, glycerin,
honey, or molasses, to cause it to bind and adhere to the
surface on which it is applied. When pressed into molds
and thoroughly dried, they are called *cake colors*; but when
sold in the form of a stiff paste they are called *moist col-
ors*. (b) A painting done in such pigments.—Young-

Heimholtz theory of color (named for Thomas Young
(1773-1829), who, however, did not prove the theory, and
Hermann Ludwig Ferdinand Helmholtz, born 1821), the
doctrine that there are three kinds of nerves in the retina,
giving respectively sensations of red, green, and violet, and
that all other color-sensations are due to the simultaneous
excitation of two kinds of nerves or of all three. *Syn.*

sible excuse, disguise.

color-blindness (kul'or-blind'ness), *n.* Incapacity for perceiving colors, independent of the capacity for distinguishing light and shade, and form. It is not a mere incapacity for distinguishing colors (for this might be due to want of training), but an absence or great weakness of the sensations upon which the power of distinguishing colors must be founded. (Color-blindness may be total, that is, the absence of all perception of colors as such, independently of light and shade, all colors appearing simply as shades; or partial, the entire or partial inability to distinguish particular colors independently of difference of light and shade. The most common form of the latter defect is the inability to perceive red as a distinct color, red objects being confounded with gray or green, and next in frequency is the inability to perceive green. The color which to a normal eye is complementary to the defective color appears as gray; and a mixture of white and black (gray) of the proper luminosity certainly cannot be distinguished by the color-

blind from the defective color (red or green). The results of statistical inquiries as to the prevalence of color-blindness show its existence in from 2 to 6 per cent. of males, while among women the number of cases seems to be considerably under 1 per cent. colorimeter (kul'or-im'ē-tēr), *n.* [= *F. colorimètre*, *< L. color, color, + -metrum, measure.*] An instrument for determining the strength of colors, especially of dyes. It consists essentially of two glass tubes of the same size, placed side by side on a stand. They are about half an inch in diameter and 15 inches high, and graduated. A standard solution of the color is placed in one tube, and in the other is placed a solution of the sample to be tested. A solid body of greater length than thickness, standing upright, and generally serving as a support to something resting on its top; a pillar; more specifically, as an architectural term, a cylindrical or slightly tapering or fusiform body, called a *shaft*, set ver-

ically on a stylobate, or on a congeries of moldings which forms its base, and surmounted by a spreading mass which forms its capital. Columns are distinguished by the names of the styles of architecture which they represent: thus, there are Egyptian, Grecian, Roman, and medieval columns. In classic architecture they are further distinguished by the names of the orders to which they belong, as Doric, Ionic, or Corinthian columns; and again, in various styles, by some peculiarity of position, of construction, of form, or of ornament, as attached, twisted, cable or ribbed, and *carolite* columns. Columns are used chiefly in the construction or adornment of buildings. They are also used singly, however, for various purposes: as, the astronomical column, from which astronomical observations are made; the chronological column, inscribed with a record of historical events; the quinque column, which supports a dial; the *itinerarium* column, pointing out the various roads diverging from it; the military column, set up as a center from which to measure distances; the triumphal column, dedicated to the hero of a victory, etc.

In *Crinoidea*, specifically, the stalk or stem of a crinoid.—6. *Milit.*, a formation of troops narrow in front and extended from front to rear: thus distinguished from a *line*, which is extended in front and thin in depth.

McPherson was in *column* on the road, the head close by, ready to come in whenever he could be of assistance. U. S. Grant, Personal Memoirs, I, 624.

7. *Naut.*, a number of ships following one another.—8. In printing, one of the typographical divisions of printed matter in two or more vertical rows of lines. The separation of columns is made by a narrow blank space in which is sometimes placed a vertical line or rule. Division into columns economizes space, and saves the fatigue of the eye arising from attempts to trace the connection of an over-long line with the following line. Hence—9. The contents of or the matter printed in such a column, especially in a newspaper: as, the *columns* of the daily press.—10. An ap-

paratus used for the fixation of colors upon fabrics by means of steam. It consists of a cylinder of copper punctured with small holes and having a steam-pipe in its interior. The printed fabrics are wrapped around the cylinder, and the steam is allowed to percolate through, setting the colors in what is called *steam style*. The column is generally used in France, while the steam-chest serving for the same operation is used in England.

No certain Teut. connection (see *ge-*). *L. com-*, in comp., usually remains before *b*, *m*, and *p* (and sometimes before a vowel (see *comitia* and *count*)), and in *OL.* in any position, and becomes *co-* before a vowel (usually) and *h*, *col-* (in classical *L.* usually *con-*) before *l*, *cor-* before *r*, and *con-* before *c*, *d*, *f*, *g*, *t* = *j*, *n* (where sometimes *co-*, *q*, *s*, *t*, *u*, and in classical *L.* as well as *ML.* often before *b*, *m*, *p*, *com-* being thus the most frequent form, often used as the normal form. In *Rom.* and in *E.* (and in similar forms in other Teut. tongues), the *L.* prefix *com-*, *con-*, *col-*, etc., generally remains unchanged, but the assimilated forms are generally reduced to *co-* in *Sp.* and partly in the other languages. In *OF.* and *AF.* *com-*, *con-*, were often *cum-*, *cun-*, whence in *ME.* *cum-*, *cun-*, *coun-*, beside *com-*, *con-*, the latter forms now prevailing in spelling, even when pronounced *cum-*, *cun-* (as in *company*, *conjure*, etc.). In a few *E.* words, as *comfit*, *comfort*, *discomfit*, *com-* (pron. and formerly written *cum-*, *ME. cun-*, *con-*) is changed from orig. *L. com-*. In many *E.* words derived through the *F.* the *L. com-* (*con-*, etc.) is concealed: see *coil* = *cull*, *cost*, *costive*, *costume* = *custom*, *couch*, *council*, *counsel*, *count*, *countess*, *countenance*, *cover*, *coverlet*, *curfew*, *curry*, *kerchief*, etc. See *co-*, *col-*, *con-*, *cor-*, and also *contra*, *counter*, *counter-*.]

A prefix of Latin origin, appearing also in other forms, *co-*, *col-*, *con-*, *cor-*, meaning 'together,' 'with,' or merely intensive, and in English words often without assignable force. See words following, and those beginning with *co-*, *col-*, *con-*, *cor-*.

The action of fire on inflammable materials; the act or process of burning. Chemically considered, combustion is a process of rapid oxidation caused by the chemical union of the oxygen of the air, which is the supporter of combustion, with any material which is capable of oxidation—that is, combustible. It results in the formation of oxygen compounds, some or all of which may be gaseous and therefore invisible, and in the liberation of energy, which is made evident by a rise of temperature and often by flame or incandescence. The weight of the products of combustion is always precisely equal to the sum of the weight of the burned substance and that of the oxygen used in the burning. The energy set free is also precisely the same as that which would be required to separate the oxygen again from its combinations. In common life oxygen is the sole supporter of combustion. In the laboratory iodine, chlorine, and some other substances also perform a similar office in certain cases. The term *combustion* has also been applied to slow processes of oxidation not attended by high temperature or evolution of light, such as the combustion in the body which keeps up the animal heat, and the slow decomposition of animal and vegetable matter in the air. See *eremacausis*.

The compression of air renders the *combustion* of gaseous matter less perfect, and, . . . within certain limits at least, the more rarefied the atmosphere in which flame burns, the more complete its *combustion*.

R. Frankland, *Exper. in Chem.*, p. 601.

Any chemical action whatsoever, if its energy rise sufficiently high, may produce the phenomenon of *combustion*, by heating the body to such an extent that it becomes luminous.

*Spontaneous *combustion*, the ignition of a body by the internal development of heat without the action of an external agent. It not infrequently takes place in heaps of rags, wool, or cotton soaked with oil, and in masses of wet coal. In the first case it is caused by the rapid spontaneous oxidation of oil, which raises the temperature sufficiently to make it burst into flame; in the second case a

similar rapid oxidation of the sulphur of pyrites contained in coal causes an increase of heat sufficient finally to ignite the coal. See *flame*.

One of a class of celestial bodies which move about the sun in greatly elongated orbits, usually elliptical or parabolic. The typical comet, as it approaches the sun, has the appearance of a bright star-like point (the nucleus) surrounded by a mass of misty light (the coma), which is

Comet of Donati, October 31, 1858.
(From "Annals of Harvard Observatory.")

extended away from the sun into a stream of light (the tail) reaching a length of from 2° to 90°. Comets which follow a parabolic orbit appear but once, their orbit being infinite, and are called *parabolic comets*; those moving in ellipses return periodically, and are called *periodic comets*. The fact of the periodicity of some comets was first established by Halley with reference to the comet of 1682. The paths in which they move are not, like those of the planets, all nearly in the same plane as the orbit of the earth, but are inclined to that orbit at all angles; and their motion along their paths, though generally direct, that is, in the same direction as that of the earth and the other planets, is sometimes retrograde. Some comets have no nucleus; and this is the case with every one while it is still very remote, when it appears as a mere nebulous patch. In this state it is called a *telescopic comet*. As it approaches the sun, the nucleus is gradually formed as a central but not sharply defined point of light; later, the tail, consisting of vaporous matter driven back by some repellent influence of the sun, often with enormous velocity, is formed; and lastly, if the comet is a bright one, a series of bright envelopes rise successively from the nucleus, each extending back into the tail, and gradually disappearing. The matter of which comets are composed is so transparent that the faintest stars are seen through them without the slightest diminution of their lustre. Of their physical constitution little is definitely known. The most remarkable discovery of recent times regarding them is the identity of the course of some of them with the orbit of certain showers of shooting stars. This was first demonstrated by the Italian astronomer Schiaparelli, who proved the agreement between the orbit of the great comet of 1802 and that of the star-shower seen annually about August 1st-10th. Three remarkable comets appeared in 1456, 1680, 1811, 1843, 1848 (Donati's), 1861, and 1874. They have always been objects of superstitious fear. See *cut* under *envelop*.

Select committee, a committee appointed to consider and report on a particular subject.—*Standing committee*, a permanent committee, as of a legislature, society, etc., intended to consider all matters within an appointed sphere. In the Congress of the United States and in the State legislatures the system of standing committees prevails. There are about 40 such committees in the United States Senate and about 50 in the House of Representatives, consisting of not less than 3 members, and except in a few cases, not more than 16. The most important committees of the House are the Committee on Ways and Means, which deals with taxes, customs, and all other revenues of the government, and the Committee on Appropriations, in which the principal appropriation bills originate. Each house has also certain select committees, but they are not important. All bills introduced into either branch of Congress, and the estimates for the needed appropriations for the different executive departments, are referred to their appropriate committees, examined, and favorably or adversely reported to the House or Senate.

4. In law, a right which one person may have to take a profit from the land or waters of another, as to pasture his cattle, to dig turf, to catch fish, to cut wood, or the like, in common with the owner of the land: called *common of pasture, of turbary, of piscary, of estovers*, etc. Common, or right of common, is said to be *appurtenant, because of vicinage, or in gross*. Common appurtenant is a right belonging to the owners or occupiers of arable land to put commonable beasts upon the lord's waste, and upon the lands of other persons within the same manor. Common appurtenant may be annexed to lands in other lordships, or extend to other beasts besides those which are generally commonable; this is not of common right, but is to be claimed only by immemorial usage and prescription. Common because of vicinage, or neighborhood, is where the inhabitants of two townships lying contiguous to each other have usually intercommoned with one another, the beasts of the one straying into the other's fields; this is a permissive right. Common in gross, or at large, is annexed to a man's person, being granted to him and his heirs by deed; or it may be claimed by prescriptive right, as by a parson of a church or other corporation sole.

Rights to hunt and fish were, in most cases, assumed by the landlords, who distributed them in the form of rights of common among their tenants. The right to fish in the lord's waters is called, in the English law, the *common of piscary*. A common of fowling is not unheard of.

Specifically—2. The freemen of England as organized in their early shires, municipalities, and guilds; the represented people.

The three estates of clergy, lords, and commons finally emerge as the political constituents of the nation, or, in their parliamentary form, as the lords spiritual and temporal and the commons. This familiar formula in either

shape bears the impress of history. The term *commons* is not in itself an appropriate expression for the third estate; it does not signify primarily the simple freemen, the plebs, but the plebs organized and combined in corporate communities, in a particular way for particular purposes. The *commons* are the "communitates" or "universitates," the organized bodies of freemen of the shires and towns; and the estate of the *commons* is the "communitas communitatum," the general body into which for the purpose of parliament these communities are combined. The term, then, as descriptive of the class of men which is neither noble nor clerical, is drawn from the political vocabulary, and does not represent any primary distinction of class.

Close communion, among Baptists, communion in the Lord's supper with Baptists only: a practice based on the belief that all who have not received baptism by immersion are in reality unbaptized, and hence not entitled to communion. Those who hold this belief are called close-communion Baptists, or close-communionists, in distinction from another class of Baptists opposed to it, and hence called open-communionists. The 33rd psalm was especially thus used in primitive times, and its eighth verse as an antiphon, "O taste and see," as also in the Mozarabic liturgy. communism (kom'ū-nizm), *n.* [*< F. communisme, < commun, common, + -isme; see common, commun, commun, and -ism.*] 1. An economic system, or theory, which rests upon the total or partial abolition of the right of private property, actual ownership being ascribed to the community as a whole or to the state. The right of the state to control the means of production, and also the distribution and consumption of the products of industry, is in general especially emphasized by the advocates of the theory. In some communistic schemes the right of the individual to the control of his own labor is also denied, each one being required to do that which is most advantageous to the community as a whole. Such theories, differing in details, have frequently been advanced—by Plato in his "Republic," by Sir Thomas More in his "Utopia," and in recent times by many writers—and have not infrequently been carried into execution on a small scale, as in the Oneida Community. See *communism*.

Communism, in its ordinary signification, is a system or form of common life in which the right of private or family property is abolished by law, mutual consent, or vow. To this community of goods may be added the disappearance of family life.

All *communists* without exception propose that the people as a whole, or some particular division of the people, as a village, or commune, should own all the means of production—land, houses, factories, railroads, canals, etc.; that production should be carried on in common; and that officers, selected in one way or another, should distribute among the inhabitants the fruits of their labor.

R. T. Ely, French and German Socialism, p. 35.

Discordant theories range from the doctrines of the *communist*, who would overturn our social structures, to those of the timid, half-hearted believers in our government, who wish to go back to restraints and powers exerted by the monarchs of Europe.

A branch of the Oneida Community also existed at Wallingford, Connecticut, but has now been withdrawn. Originally the Oneida Community was strictly communistic, all property and all children belonging primarily to the society, and the restrictions of marriage being entirely abolished; but in 1879, owing to the increasing demand of public opinion that the social practices of the society should be abandoned, marriage and family life were introduced, and in 1880 communism of property gave place to a joint-stock system, and the Community was legally incorporated as "the Oneida Community, Limited." — *Village community*, an early form of organization, in which the land belonged to the village, the arable land being allotted by it to the members or households of the community, by more or less permanent arrangements, the waste or common land remaining undivided.

The usual optical comparator has two microscopes, firmly attached to a bar or something of that sort, with their focal planes coincident and furnished with star micrometers, whose screws lie virtually in one right line. There is also a carriage moving at right angles to the screws, so as to bring first one bar and then another under the microscopes. In Saxton's comparator a beam of light is caused to fall on a mirror delicately supported on its axis, round which a very fine chain is wound, the other end being attached to a lever provided with a spring in such a way that the mirror is turned one way or the other as the bar contracts or expands, or is replaced by a shorter or longer bar. The mirror throws the beam upon a large scale at some distance, where it indicates by a large movement the very minute movements of the mirror. One form of color-comparator employs a glass prism, which may be filled with a colored liquid, and a series of glass tubes containing colored solutions of known tints and shades.

compare¹ (kom-pär'), *v.*; pret. and pp. *compared*, *ppr. comparing*. [= *F. comparer* = *Pr. Sp. =*Syn.* *Compare*, *Compare to*, *Compare with*, *Contrast*. When one thing is compared to another, it is to show that the first is like the second, as, in Luke xv., the sinner is compared to a lost sheep, etc.; when one thing is compared with another, it is to show either difference or similarity, especially difference: as, the treatment of the Indians by Penn may be compared with the treatment of them by other colonists of America. *Compare* and *contrast* imply equality in the things examined; *compare to* and *compare with* do not, the object of the verb being the principal subject of thought.

5. In *gram.*, the variation of an adjective or (much more rarely) adverb to express a higher and the highest degree of what is denoted by the adjective or adverb. The degrees expressed thus in English, and in most of the languages related with English, are three (including as first the primitive word): *positive* (so called by antithesis to the others), as *strong, weak, often, comparative*, as *stronger, weaker, oftener*, and *superlative*, as *strongest, weakest, oftenest*. Adjectives not admitting this variation, and many adverbs, express like degrees by prefixing the comparative adverbs *more* and *most*: as, *more glorious, most glorious; more weakly, most weakly*; and such phrases often receive, less properly, the same names as the forms of equivalent value.

7. An instrument used to indicate the magnetic meridian, or the direction of objects with reference to that meridian. The mariners' or ship's compass consists of three parts, viz., the *bowl*, the *card*, and the *needle*. The bowl, which contains the card and needle, is usually a hemispherical brass receptacle, suspended by two concentric brass rings (called *gimbals*) in such a manner that the bowl is kept in a horizontal position, notwithstanding the motion of the ship. The circular card is divided into 32 equal parts by lines drawn from the center to the circumference, the points of intersection with the circumference (or the radial lines, or *rhumbs*, thence) being called the *points of the compass*. The intervals between the points are also divided into halves and quarters. The whole circumference is divided into 360 degrees; consequently, the angle between any two adjoining points is 11° 15'. The four principal divisions (dividing the circumference into four equal parts) are called the *cardinal points*, viz., north, east, south, and west. The names of the others are compounded of these; and if the direction or bearing referred to lies between any two points, quarter or half points are added, as N. E. by E.; or it is expressed in degrees, as south 42° west. The needles, of which there are generally from two to four, fastened to the bottom of the bowl, consist either of laminæ or layers of hardened steel or of bundles of steel wire. In the center of the card is a conical socket poised on an upright pin fixed in the bottom of the bowl, so that the card hanging on the pin turns freely round its center. On ship-board the compass is so fixed that a black mark, called the lubber's line, coincides with an imaginary line parallel to the keel of the ship, and the point of the compass card which is directly against this line indicates the direction of the ship's head. The indication is, however, subject to a certain modification, owing to the variation of the magnetic meridian (see *variation*) and the deviation of the needle caused by the iron in the ship (see *deviation of the compass*, under *deviation*). The regulation compass in the United States navy, and the one also used on many mail steamers, is known as Kitchin's liquid compass, in which the card is a skeleton, and the bowl, having a glass top, after being filled with a fluid composed of about one third alcohol and two thirds water, is hermetically sealed.

composing-machine (kom-pō-zing-mā-shēn'), *n.* A type-setting machine. The earliest composing-machine, invented by William Church in 1821, attempted to make the types as well as set them. This special and instantaneous making of the types is also the basis of more recent inventions; but most composing-machines are constructed to set types previously made. The types are specially grooved or nicked to fit them for being set automatically. The arrangement of classified types in separate channels, and their dislodgment in order into a larger channel by means of levers touched from a finger-board, are features common to most composing-machines, widely as they may differ in other details of construction. Few of these machines have come into practical use, owing especially to the difficulty of separating or distributing the types by an automatic process in the special manner required. See *linotype*.

composing-stand (kom-pō-zing-stand), *n.* In printing, an elevated framework, usually of wood, on which the type-cases are placed in inclined positions, the part for the upper case having a steeper slope than that for the lower. Also called *composing-frame*, or in common use *frame* or *stand*.

Composing-stick

and arranges the types that he picks out of the cases with his right hand. The composing-stick is fitted with a knee, adjustable, by means of a screw or a clamp, to any length of line required in printed work. The earliest composing-sticks were sticks of wood, with knees specially tacked on for different lengths of line; but wooden sticks are now used only in setting hand-sets, or for other work requiring very long lines.

Compositae (kom-poz'it-ē), *n. pl.* [NL, fem. pl. (see *L. placidus*, plants) of *L. compositus*, composite: see *composite*.] The largest natural order of plants, including over 750 genera and 10,000 species, distributed all over the globe wherever vegetation is found, and divided equally between the old world and the new. They form about a tenth of all phanerogamous plants, an eighth of those of North America, and in some regions even a larger proportion. They are in this or much more rarely shrubs, scarcely ever arborescent, and are of comparatively slight economic importance. A few species are cultivated for food, as the artichoke (*Cynara*), the sunflower (*Helianthus*), and the lettuce (*Lactuca*); others have useful medicinal properties; and a very large number are cultivated for ornament. The flowers are gamopetalous and mostly pentamerous, sessile in a close head (the compound flower of early botanists, whence the name of the order), and surrounded by an involucre of separate or connate bracts. The ovary is inferior and one celled, and becomes an achene in fruit, the only limb being reduced to a circle of hairs, awns, scales, or teeth, called the *pappus*. The stamens are inserted on the corolla, and their anthers are united into a tube, on which account the name *Synanthus* has been sometimes given to the order. The genera of the order are divided into three series, depending upon the character of the corolla, viz.: (1) the *Labiatae* (see *Mutandae*, of 59 genera, largely South American), having a bilabiate corolla, at least in the perfect flowers; (2) the *Ligulatae* (or *Cichoriaceae*, of 54 genera, mostly of the old world), in which the corollas are all ligulate (strap-shaped); and (3) the *Tubuliflorae*, having regular tubular corollas in all the perfect flowers. The last series is again divided into 11 tribes. The 10 largest genera of the order, including three tenths of the species, are *Senecio* (840 species, largely of South America and southern Africa), *Eupatorium* (430 species, all American), *Fernandea* (375 species, mostly tropical), *Centauria* (310 species, of the Mediterranean-Asian region), *Baccharis* (250 species, mostly South American), *Helianthus* (225 species, of southern Africa and Australia), *Aster* (171 species, largely North American), *Cnicus* (165 species, of the Mediterranean-Asian region and North America), *Artemisia* (152 species, of Europe, Asia, and North America), and *Hieracium* (150 species, of Europe, Asia, and North America). By far the largest North American genus is *Aster* (124 species), followed by *Solidago* (78), *Eriogonum* (71), *Senecio* (57), *Aplopappus* (43), *Artemisia* (42), *Helianthus* (42), *Eupatorium* (33), *Cnicus* (33), *Bignonia* (31), and *Brickellia* (31); these genera include two fifths of the species of North America. Also called *Asteraceae*.

See *cut under Polyzoa*.—**Compound archway**, in *medicinal arch.*, a series of arches of different sizes, inclosed in an arch of larger dimensions.—**Compound axle**, beam-engine, bolster, ether, event, etc. See the nouns.—**Compound eyes of insects**. See *eye*.—**Compound flower**, the flower of a plant of the order *Compositae*. See *Compositae*.—**Compound fraction**, *fracture*, *fruit*. See the nouns.—**Compound householder**, in Great Britain, a householder who compounds with his landlord for his rates—that is, whose rates are included in his rent.

Compound ratio, the ratio which the product of the antecedents of two or more ratios has to the product of their consequents. Thus, 6 to 12 is a ratio compounded of 2 to 6 and of 3 to 12, because $\frac{6}{12} = \frac{2}{6} \times \frac{3}{12}$. In like manner the ratio of ab to cd is a ratio compounded of a to c and of b to d ; for $\frac{ab}{cd} = \frac{a}{c} \times \frac{b}{d}$. Hence it follows that in any continued proportion the ratio of the first term to the last is compounded of all the intermediate ratios. See *ratio*.

Upon this concession by the proslavery party in Congress, Missouri was admitted as a slave State. Its repeal in 1854, in the act for the admission of Kansas (10 Stat., 289, c. 50, § 32), led to disturbances of considerable historical importance in Kansas.

conaria, *n.* Plural of *conarium*.

conarial (kō-nä'ri-äl), *a.* [*< conarium + -äl*.] Of or pertaining to the conarium, or pineal body of the brain.—**Conarial fossa**, a depression of the roof of the skull of some animals, in which the conarium is lodged.—**Conarial tube**, the more or less extended cavity or canal of the pineal body, now commonly supposed to be the remnant of the passage by which in vertebrates generally the primitive cavity of the myelencephalon communicated with the outer surface of the head. In man and the higher vertebrates generally the conarium appears to be deep-seated in the brain; but this is deceptive, and merely owing to the overgrowth of the cerebrum. The conarium is morphologically on the superior surface of the brain, whatever its apparent situation, and there is much reason to suppose that the large openings of the top of the skull in sundry Tertiary mammals, called the parietal foramina, indicate the extension of the conarial tube to the surface, and the formation there of a visual or other special-sense organ. On this view, the conarium is the vestige of an extinct eye. See *conarium*.

It is a small reddish body developed from the hinder part of the roof of the first cerebral vesicle, and lying in front of and above the nates. Its substance consists mainly of epithelial follicles and connective tissue; there is no evidence that it is a nervous structure, and its function, if it possess any, is unknown. It was formerly supposed by some (as by the Cartesians) to be the seat of the soul. See *conarium*, and cuts under *corpus* and *encephalon*.

All thought is a comparison, a recognition of similarity or difference; a conjunction or disjunction . . . of its objects. In *Conception*, that is, in the forming of concepts (or general notions), it compares, disjoins, or conjoins attributes. *Sir W. Hamilton, Logic, I.*

Conception means both the act of conceiving and the object conceived. . . . Now this is a source of great vagueness in our philosophical discussions. . . . For the act of conceiving, the term *Conception* should be employed, and that exclusively. *Sir W. Hamilton, Logic, VI.*

It is mainly an English doctrine, and Locke is the most celebrated advocate of the opinion. The term is also applied to some of the opinions concerning universals held in the middle ages, under the impression that the questions then at issue were the same as that discussed by the English philosophers.

Dr. Brown repudiates the doctrine of conceptualism as held by Locke and others. He admits that we can represent to ourselves no general notion of the common attribute or attributes which constitute a class; but he asserts that the generality, which cannot be realized in a notion of the resembling attribute, is realized in a notion of the resemblance itself.

Sir W. Hamilton, *Metaph.*, xxxvi.

Thus, a judgment for a debt is said to be conclusive evidence of the indebtedness it establishes, because, having been put in evidence against the debtor, he cannot usually give other evidence merely in denial of the indebtedness, unless he first gives evidence sufficient to avoid the judgment. Such evidence is said to raise a *conclusive presumption* of the fact it is adduced to prove. The phrase *conclusive evidence* is also used, more loosely, of evidence which, though not necessarily conclusive, yet, not having been contradicted, is sufficient as matter of law to oblige a jury to come to the proposed conclusion. — *Syn.* 1. *Eventual*, *Ultimate*, etc. (see *final*), convincing, decisive, unanswerable, irrefutable.

Concords of more than two tones contain only the above intervals between every pair of their constituent tones; but the triad, consisting of the 2d, 4th, and 7th of the scale when the 2d is in the lowest voice, is ranked as a concord, notwithstanding the dissonance between the 4th and 7th. (See *triad*, and *common chord*, under *chord*.) Concords of two tones are acoustically distinguished from discords by the simplicity of the ratios between the vibration-numbers of the tones; thus, the ratios of the above concords are 1, 3, 2, 4, 3, 2, and 4 respectively. Specifically — (a) Any device for reducing gases or vapors to liquid or solid form. The reduction is usually effected by lowering the temperature of the vapor by contact with chilled surfaces. A form of condenser common in the laboratory is shown in the figure. From the flask, A, the vapor to be condensed escapes through the tube B, which passes through a larger condenser tube. A stream of ice-water enters the condenser through C, and passes off through D, keeping the surface of the inner tube, B, C, chilled, and the vapor entering the tube from A is condensed and drops from C as a liquid. Condensers used to concentrate vapors or gases, as steam, alcoholic vapors, fumes, volatile liquids, etc., commonly depend upon the reducing effects of a lower temperature. In them the vapor, gas, smoke, or fumes are brought into immediate contact with chilled surfaces. This is accomplished in a great variety of ways, as in the surface condenser of the steam engine, the worm of a still, or the long convoluted tubes in which poisonous fumes or smoke are cooled before being allowed to escape to the chimney. The cooling surfaces are usually kept cold by water, as in the still, the gas-condenser, the sugar-condenser, etc. For fumes and smoke, the contact with walls exposed to the air is sufficient. (b) A part of a cotton gin which compresses the lint for convenient handling. (c) In *wool-manuf.*, a machine which forms the wool received from the doffer of a carding-engine or comb, and rolls it into slubbings. The doffer of the carding-engine is covered by a series of parallel strips of card-cloth, wrapped about the cylinder. The wool thus comes off in a number of loose flat ribbons of fleece, which in the condensing-machine are carried by a leather apron beneath a roller which has a reciprocating motion transverse to their direction, and thus rolls these slivers into loose slubbings, which are wound upon a roll and are ready for spinning. (d) In the manufacture of sugar, the apparatus used for concentrating the clarified juice, preparatory to its final concentration in the vacuum or evaporating-pan. The liquor trickles over the surface of steam-pipes, where heat evaporates the water which constitutes the greater part of the cane-juice. (e) In optical instruments, a lens, or combination of lenses, used to gather and concentrate the rays of light collected by a mirror and direct them upon the object, as the bull's-eye condenser (see *bull's-eye*, p.) and the achromatic condenser used with the microscope. — **Achromatic condenser.** See *achromatic*.

— **Condenser hygrometer,** a dew-point hygrometer. See *hygrometer*.

Condenser of electricity, any apparatus by which electricity can be accumulated, usually consisting of two conducting surfaces separated by a non-conductor, as in the condenser of *Edison* (see figure), which is charged by connecting one of the plates (A) with the electrical machine and the other (B) with the ground; their distance from the glass plate (C) can be adjusted at will. A practical form of condenser is the Leyden jar (which see, under *jar*). Condensers are much used in connection with submarine telegraphy; one of the Atlantic cables has a condenser with over two acres of surface of tin-foil, arranged in plates separated by waxed paper

and paraffin. The term is also applied to such instruments as are employed to collect and render sensible very small quantities of electricity, as the condensing electro-

Merit; desert. — 2. In *scholastic theol.*, specifically, the merit of human actions considered as constituting a ground for a claim of reward.

Condignity and *congruity* (*meritum de condigno* and *de congruo*) are terms used by the schoolmen to explain their peculiar opinions relative to human merit and deserting. The *Scottists* maintain that it is possible for man in his natural state so to live as to deserve the grace of God, by which he may be enabled to obtain salvation; this natural fitness (*congruitas*) for grace being such as to oblige the Deity to grant it. Such is the merit of congruity. The *Thomists*, on the other hand, contend that man, by the divine assistance, is capable of so living as to merit eternal life, to be worthy (*condignus*) of it in the sight of God. In this hypothesis, the question of previous preparation for the grace which enables him to be worthy is not introduced. This is the merit of *condignity*.

8. In law: (a) A statement that a thing is or shall be, which constitutes the essential basis or an essential part of the basis of a contract or grant; a future and uncertain act or event not belonging to the very nature of the transaction, on the performance or happening of which the legal consequences of the transaction are made to depend. More specifically, a *condition* is a provision on the fulfillment of which depends the taking effect or continuance in effect of the instrument or some clause of it, or the existence of some right established or recognized by it, as distinguished from a *covenant*, which is a promise in a sealed instrument the breach of which may give rise to a claim for damages, but not necessarily the forfeiture of any right. The performance of a *covenant*, however, may be made a *condition* of the continued efficacy of the agreement. A *condition precedent* is a provision which must be fulfilled or an event which must occur before the instrument or clause affected by it can take effect. A *condition subsequent* contemplates that, after the instrument has taken effect, a right established or recognized by it may be extinguished by some future or uncertain event.

It is distinguished from a convection, by which heat and electricity are carried by moving particles; from the radiation of heat, which does not raise the temperature of the intermediate points (except so far as the radiation is hindered); and from the discharge and the electrolytic transfer of electricity.

conductivity (kon-duk-tiv'i-ti), *n.* [*< conductive* + *-ity*.] In *physics*, the power of conducting heat, electricity, or sound; the property of being *conductive*. In the case of heat (thermal conductivity) solids have in general a much higher degree of conductivity than liquids, and liquids than gases, the last being practically destitute of conductive power; both liquids and gases become heated by convection (which see), not by conduction. Furthermore, among solids the conductivity of metals for heat is greater than that of stony bodies, that of animal and vegetable substances being the least of all. Metals have also a relatively high degree of conductivity for electricity, a charge of electricity distributing itself freely over a metallic surface, and an electrical current passing more or less readily through a metallic wire. Those metals which are the best conductors of heat, as silver, copper, and gold, are also the best electrical conductors. The conductivity of many solids (glass, sulphur, resin) is nearly zero for electricity; the same is true to a less degree of most liquids and also of gases. With any substance the conductivity for electricity is the reciprocal of the resistance. See *resistance*.

Conductivity varies not only with varying temperature, but also with varying tension, torsion, or pressure.
A. Daniell, Prin. of Physics, p. 564.

[U. S.] —6. Confederate States of America, the name assumed by the southern States which seceded from the American Union in 1860–61, on the occasion of the election of a President (Abraham Lincoln) and Congress unfriendly to the institution of slavery, and formed a government under a constitution adopted by a general convention at Montgomery, Alabama, on March 11th, 1861. The confederation ultimately consisted of the following eleven States, which adopted ordinances of secession in the order given, the first on December 20th, 1860, and the last on May 20th, 1861: South Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, Texas, Virginia, Arkansas, Tennessee, North Carolina. They were readmitted to their former status as equal members of the United States after a little more than four years of civil war (the first actual hostilities occurring at Fort Sumter in South Carolina on April 12th, 1861, and the last in Texas on May 13th, 1866), and after a period of reconstruction and the acceptance of certain amendments to the federal Constitution, one of which abolished slavery. Abbreviated *C. S. A.*

confederation (kon-fed-ə-rā'shən), n. 2. An aggregate or body of confederates, or of confederated states; the persons or states united by a league.

A confederation is a union, more or less complete, of two or more states which before were independent. Woolsey, Intro. to Inter. Law, § 104.

Articles of Confederation, in U. S. hist., the compact or constitution adopted by the Continental Congress in 1777 and ratified by the separate colonies within the next four years. The government formed under this compact, which went into effect on March 1st, 1781, was without an executive and judiciary, consisting simply of a congress of one house, in which each State had one vote; it was empowered to declare war and peace, make treaties with foreign powers, direct the land and naval forces in time of war, make requisitions upon the separate States for their quota of the money necessary for national expenses, regulate the value of coin, control the postal service, etc. As it had no power to enforce its laws upon the States, it soon fell into contempt, and on March 4th, 1789, expired by limitation under the provisions of the present Constitution. - **New England Confederation**, the union effected by the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven in 1643, suggested by the need of a common defense against the Dutch and the Indians. It was discontinued in 1684. - **Syn. Confederation, Confederacy, Federation.** A confederation or confederacy is sometimes distinguished from a federation as follows: Both designate a union of distinct states. In a federation, however, the essential sovereignty, as exercised toward foreign countries, is regarded as irrevocably deposited in the hands of the central government, and only a constitutionally limited autonomy in internal matters is retained by the constituent territories; while in a confederation the sovereignty may be conceived as still existing in the constituents and exercised more or less extensively by the general government as delegated agent: a confederacy is regarded as even less permanent than a confederation. Thus, the union of the thirteen colonies before 1789 was a confederation, while the United States since that time have constituted a federation. The above distinction, however, is not strictly adhered to in the ordinary use of these words.

—3. A formulary which comprises articles of religious faith; a creed to be assented to or signed as a preliminary to admission to the membership of a church, or to certain offices of authority in the church: usually called a *confession of faith*. The great confessions of faith of the Protestant Christian church are: the Augsburg Confession (1520), a part of the symbol of the Lutheran Church; the first and second Helvetic confessions (1536 and 1566), symbols of the Reformed churches of Switzerland, the latter being approved by nearly all the Reformed churches of the Continent and of England and Scotland; the Gallican Confession (1559), also called the Confession of Rochelle, prepared by Calvin and his pupil Dr. Chandieu, the symbol of the French Protestant church; the Belgic Confession (1561, revised 1619), the symbol of the Reformed churches in Belgium and the Netherlands, and of the Reformed (Dutch) Church in the United States; the first Scotch Confession (1560) and the second Scotch Confession or the National Covenant (1637), the symbols of the Scotch church before the adoption of the Westminster Confession; the Thirty-nine Articles of the Church of England (1537 and 1571); the American revision of the same (1801), the symbol of the Protestant Episcopal Church in the United States; the Irish Article (1615), at present recognized by the Dutch Church, and by the Reformed (Dutch) Church in the United States; the Westminster Confession (1647), the symbol of the Presbyterian Church in England, and of Scotland (taking the place in Scotland of the so-called Scotch confessions), and, with some alterations, of the Presbyterian Church of America; the Savoy Confession (1658), adopted by the Independents at the Savoy palace, London; the declaration of the Congregational Union of England and Wales (1833), of the Boston (United States) National Council (1835), and of the Oberlin National Council (1871), symbols of Congregational churches; the Articles of Religion (1794) of the Methodist Church; the Confession of 1688, and the New Hampshire Confession (1833), symbols of the Baptist Church. See *catechism*, *creed*.

4. [**ML.** *confessio*(-n-).] The tomb of a martyr or confessor. If an altar was erected over the grave, the name was extended also to the altar and to the subterranean chamber in which it stood. In later times a basilica was sometimes erected over the chamber; the high altar was placed over the altar on the tomb below, and so this high altar also, and subsequently the entire building, was called a *confession*. Also called *confessional*, and in the

Greek Church *catabasis* or *catabasion*. — **Auricular confession**. See *sacramental confession*, below. — **Confession and avoidance**, in law, the substance of a pleading by which the party admits the allegation of his adversary's pleading to be true, but states some new matter by way of avoiding its legal effect. — **Confession of faith**. See 3, above. — **Confession of judgment**, the acknowledgment of a debt by a debtor before a court or a justice of the peace, etc., on which judgment may be entered and execution issued. — **General confession**. (a) A confession made to a priest of sins committed by the penitent since baptism or since infancy, so far as those sins can be remembered; a confession made in preparation for baptism by one baptized after coming to years of discretion, also before admission to a monastic order. (b) [*prop.*] In the Book of Common Prayer: (1) The form of acknowledgment of sins to be said by the minister and the whole congregation at the beginning of Morning Prayer and Evening Prayer. (2) The form of confession in the Communion office. — **Judgment by confession**, a judgment obtained on a confession made to a court or a magistrate, or by the withdrawal of the defense, or against a plaintiff by *nolle prosequi*. — **Sacramental or auricular confession**, the act or practice of confessing sins to a priest, for the purpose of receiving absolution. At a very early period, for gross apostasy or other public sins, public confession was required as a condition precedent to partaking of the communion. Public confession was gradually abolished in order to prevent scandal and social and legal complications. Auricular confession was first made universally obligatory in the West as a condition of admission to communion by the fourth Lateran Council in A. D. 1215. It is now required in the Roman Catholic Church from all who are conscious of mortal sins, and is regarded as essential to absolution and divine pardon, and a necessary prerequisite to partaking of the communion. Priests are bound in the strictest manner never to disclose a secret thus confided to them. Confession is obligatory in the Orthodox Greek and in the Armenian Church. The Anglican Church differs from the Roman Catholic and the Eastern Church in not making it obligatory, but leaving it to the conscience of the individual. — **Seal of confession**, in the *Rom. Cath.* and in the *Gr. Ch.*, absolute secrecy incumbent on a priest with regard to all private confessions of sins made to him. A similar secrecy is enjoined by the 113th canon of the Church of England. Also called the *seal*, and the *sacramental seal*.

Confident person, in *Soda law*, a partner in trade, a factor, steward, or confidential man of business; also, a servant or other dependant. — **Syn.** 1. *Sure*, *Certain*, *Confident*, *Positive*, *Dogmatic*. — *Sure* is the simplest and most general of these words; it has the strength of simplicity. *Certain* suggests the idea of having been freed from doubt, having been made sure. *Confident* belongs especially in the field of belief; as, he is *confident* of success. In regard to opinion or belief it may mean no more than *sure*, or it may suggest reliance, as on one's own judgment or upon evidence: as, a *confident* expectation, hope, belief. It implies a desire for that of which one is *confident*. *Positive* runs close to over-confidence or dogmatism: as, he was *positive* that he had made no mistake; it expresses emphatic certainty that will not entertain a doubt of its correctness. (*For dogmatic, see unqualified*.) That *confident* and *positive* depend somewhat upon the will, and not merely, like *sure* and *certain*, upon the understanding, is shown by the fact that it is not correct to say "I will not be *confident*, or *sure*, about this," while it is correct to say "I will not be *positive*, or *confident*, about it."

(e) *Eccles.* (1) A rite whereby baptized persons are admitted to full communion with the church. In the Roman Catholic, Greek, and Anglican churches it consists of the imposition of hands and prayer by a bishop (or in the Greek Church by episcopal authority), preceded in the two former by metonymy or anointing with chrism. In the first two churches it is regarded as the confirming or strengthening of the grace given in baptism and the bestowal of the gifts of the Spirit. In the Anglican Church, high churchmen and low churchmen regard it from different points of view, the latter attaching especial importance to the personal renewal made in it, by the persons confirmed, of the vows taken by others in their name at baptism, while the former believe it to be essentially a sacramental rite, conveying the strengthening power of the Holy Ghost. This rite is believed to be recorded in the New Testament as a laying on of hands following baptism, distinct from ordination, and administered by apostles only. A function was discontinued in the Anglican Church not long after the Reformation. In the early church confirmation immediately followed baptism, and the Greek Church has always retained this practice; in the West, however, the two have been separated since the thirteenth century by an interval of seven years or more. Formerly confirmation was sometimes allowed to be administered by presbyters if authorized by the bishop; and this is still the case in the Greek Church, where it is administered by priests with chrism consecrated by a bishop. Confirmation is one of the seven great religious rites, distinctively called *sacraments* by the Roman Catholic Church, and *sacraments* or *mysteries* by the Greek. The Anglican formularies mention it as one of "five commonly called sacraments," but do not place these in the same rank with baptism and the Lord's supper as sacraments "ordained of Christ our Lord in the Gospel." (See *sacrament*.) In the Lutheran and Reformed churches the rite is administered by the pastors. Other Protestant denominations reject it.

The Fathers . . . held *confirmation* as an ordinance apostolic always profitable in God's Church. *Hooker, Eccles. Polity*, v. 66.

Confucian (kon-fü'shian), *a.* [*< Confucius*, a Latinized form of Chinese *K'ung-fü-tse* (also written in E. *Kung* or *Kong-fu-tsi*), lit. 'K'ung the philosopher,' + *-an*.] 1. Of or pertaining to Confucius, the celebrated philosopher of China (551-478 B. C.), or to his teachings: as, the *Confucian ethics*; *Confucian literature*. See *Confucianism*.—2. Erected or maintained in honor of Confucius: as, a *Confucian temple*.

Confucianism (kon-fü'shian-izm), *n.* [*< Confucian* + *-ism*.] Properly, the ethico-political system taught by Confucius. He sought (unsuccessfully) to remedy the degeneracy and oppressions of his time, and to secure peace and prosperity to the empire, by the spread of learning and the inculcation of virtue, setting up as models to be imitated the "ancient kings" Yao and Shun (about 2550-2204 B. C.), who, by their virtue and the force of their individual character, were said to have removed evil, poverty, and ignorance from the empire. The system of Confucius was essentially mundane in its method and aims, being based upon the proper discharge of the duties involved in the five relationships of life, namely, those of prince and subject, parent and child, brother and brother, husband and wife, and friend and friend. By many Confucianism is called one of the three religions of China, the others being Taoism and Buddhism. In this sense the term includes both the Confucian scheme of ethics and statecraft and the ancient native religion (for

which the name *Sinism* has been proposed) existent in China from the dawn of Chinese history, and still observed as the state religion. Its chief features are: (1) the worship of the Supreme Being (Shang-ti) by the emperor on behalf of the people; (2) the worship of "the host of spirits," as the gods of the winds, of the rivers, of the mountains, the grain, etc., by the officials and dignitaries; and (3) the observance of ancestral worship and filial piety by all. (See *Sinism*.) By others the term has been still further extended, so as to include the cosmogonic speculations of Chu-hi and the other speculative philosophers of the twelfth century. The only Chinese term corresponding in any degree to the word *Confucianism* is *Yu-kiao*, 'the system of the learned.'

Confucianism pure and simple is in our opinion no religion at all. The essence of *Confucianism* is an antiquarian adherence to traditional forms of etiquette—taking the place of ethics; a sceptic denial of any relation between man and a living God—taking the place of religion; while there is encouraged a sort of worship of human genius, combined with a set of despotic political theories. But who can honestly call this a religion? *China Rev.*, VIII, 59.

I use the term *Confucianism* . . . as covering, first of all, the ancient religion of China, and then the views of the great philosopher himself, in illustration or modification of it. *J. Legge, Religious of China*, p. 4.

5. Formerly, in the English colonies of North America, a parish, hundred, town, plantation, or other settlement.—6. In the *Rom. Cath. Ch.*:

(a) One of the committees of cardinals appointed by the pope to aid him in the transaction of the business of the church. The decisions of these congregations are ordinarily regarded as equivalent to decisions of the pope himself. There are eleven regular congregations, namely: (1) the *Congregation of the Consistory*, which prepares the business to be brought before the consistory or assembly of all the cardinals (see *consistory*); (2) the *Congregation of the Holy Office of the Inquisition*, which tries all cases of heresy brought before it, and formerly heard appeals from lower inquisitorial courts, and sent inquisitors where needed (see *inquisition*); (3) the *Congregation of the Index*, which decides what books shall be placed upon the Index Expurgatorius, or list of forbidden books (see *index*); (4) the *Congregation of Rites*, whose duty is to promote a general uniformity of the externals of divine worship, and to decide with regard to the beatification and canonization of any one whose name is proposed therefor; (5) the *Congregation of Immunities*, which is charged with the duty of determining all matters concerning the right of asylum, and such as relate to ecclesiastical jurisdiction where it comes in contact with the civil power; (6) the *Congregation of the Fabric*, which is charged with everything that relates to the conservation of St. Peter's; (7) the *Congregation of the Council* (that is, of Trent), which is the official interpreter of the decrees of the Council of Trent on all matters of discipline whenever questions arise thereon, the interpretation of its articles of faith being reserved to the pope himself; (8) the *Congregation of Bishops and Regulars*, which disposes of such differences as may arise between the bishops and the regular communities within their respective dioceses; (9) the *Congregation of Discipline*, which superintends the interior discipline of monastic establishments; (10) the *Congregation of the Propaganda*, which has charge of the missions of the church, and of the College of Propaganda, an institution at Rome for the instruction of men intended for missionary work (see *propaganda*); (11) the *Congregation of Indulgences*, which superintends the examination and certification of the authenticity of relics and the grant of indulgences. Other special congregations are also appointed by the pope. *Cath. Dict.* (b) A religious community bound together by a common rule, but not by the solemn and irrevocable vows which characterize the monastic orders. Among them are the Oratorians, the Dames Anglaises, the Fathers of the Mission or Lazarists, the Oblates, the Passionists, the Redemptorists, the Mariists, and the Christian Brothers. (See *Christian Brothers*, under *Christian*.) (c) A group of monasteries which agree to practise the rules of their order more strictly in their respective houses, and unite themselves together by closer ties, such as the congregations of Cluny and St. Maur.

As a broad general rule, nearly every post-Reformation institute is styled, not an "Order," but a "Congregation"; but the only distinction which can be drawn between these two names is that "order" is the wider, and may include several *congregations* within itself (as the Benedictine order, for example, includes the *congregations* of Cluny and of St. Maur), while a *congregation* is a simple unit, com-

plate in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.

Encyc. Brit., XVI, 716.

(d) A committee of bishops appointed by the pope, or with his approbation, to prepare rules of business, etc., for a general council. In the General Council of Constance the congregation was differently constituted, the Council being divided into congregations according to the nationalities represented—German, French, Italian, English, and subsequently Spanish. These voted separately, preliminary to the final action of the Council as a whole.

Thus, if $A = 0$ is the equation of one locus, and $B = 0$ that of another, then $AB = 0$ is the equation to the congregation of them.—**Congregation of Our Lady of Calvary**, a French order of Benedictine nuns founded at Poitiers in the beginning of the seventeenth century, broken up by the revolution, but afterward reorganized and reestablished.—**Congregation of the Mother of God**, a monastic order instituted about 1574 at Lucca in Tuscany by John Leonardi, and approved and confirmed by the papal see.—**Free Congregations**, also called *Friends of Light* or *Protestant Friends*, a name adopted by congregations of German rationalistic religious thinkers, who broke away from the established church of Prussia about 1845. They denied the authority of the Bible and the truth of important Christian doctrines, and some of them also the existence of a personal Deity. As they became politically powerful, they were suppressed in Saxony and Bavaria, and continued to exist in Prussia only under great difficulties. There are some of these congregations in the United States.—**Lords of the Congregation**, in *Scot. ch. hist.*, a title given to the chief nobles and gentlemen who signed the Covenant of December 3d, 1557, for liberty of worship. The whole body of adherents was called the *Congregation*, from the frequent recurrence of the word *congregation* in the document.—*Syn.* 4. See *spectator*.

congregational (kong-grē-gā'shon-al), *a.* [*< congregation + -al.*] 1. Of or pertaining to a congregation; as, *congregational singing*.—2. *Eccles.*, pertaining to government by congregations; governed by its own congregation, as a church; specifically (with a capital), pertaining to Congregationalism as a denominational designation; as, the *congregational polity* of the Baptists; the *Congregational churches* of the United States.

The great Baptist denomination—with some leaning toward Independency properly so called—is yet purely *Congregational* in its principle of church order and government.

Congregational council. See *council*.—**Congregational music**, music in which the congregation take part, as opposed to music sung by the choir only.—*Syn. Congregational, Independent*. See extract under *congregationalism*.

congregationalism (kong-grē-gā'shon-al-izm), *n.* [*< congregational + -ism.*] 1. A system of church government based upon the autonomy of the individual congregation. It embodies three fundamental principles—(1) that it is the right and duty of believers in Jesus Christ in every community to organize for Christian work and worship, and that such an organization is a Christian church; (2) that each such church is by right independent of all external ecclesiastical control, and in any such church all members possess equal ecclesiastical authority; (3) that such churches owe a duty of Christian fellowship and cooperation to one another. This fellowship and cooperation is exercised among those who bear the name of congregationalists by means of councils, conferences, associations, and associations. The principles of congregationalism are maintained not only by Congregationalists so called, but also by Baptists, Unitarians, Universalists, and some other denominations of Christians, and by many evangelical churches in France, Switzerland, etc.

Congregationalism is the democratic form of church order and government; it derives its name from the prominence which it gives to the congregation of Christian believers. It vests all ecclesiastical power (under Christ) in the associated brotherhood of each local church, as an independent body. At the same time it recognizes a fraternal and equal fellowship between these independent churches, which invests each with the right and duty of advice and reproof, and even of the public withdrawal of that fellowship in case the course pursued by another of the sisterhood should demand such action for the preservation of its own purity and consistency. Herein *Congregationalism* as a system differs from Independency, which affirms the seat of ecclesiastical power to reside in the brotherhood so zealously as to ignore any check, even of advice, upon its action.

2. [*cap.*] The system of ecclesiastical polity and religious doctrine maintained by the Congregational Church. See *congregationalist*, 2.

congregationalist (kong-grē-gā'shon-al-ist), *n.* [*< congregational + -ist.*] 1. One who holds to the congregational principles of church government. See *congregationalism*, 1. In this sense, *Rep-*

tists, Unitarians, Universalists, some Methodists, and some other denominations of Christians are congregationalists.

2. [*cap.*] One of a denomination of Christians who hold to the congregational principle of church government, to the system of doctrines known as evangelical or orthodox, to the legitimacy of the baptism of infants, and to baptism by sprinkling. The Congregationalists of the United States are identical in origin and general principles with the Independents (now also called *Congregationalists*) of Great Britain. They were the predominant religious body in the first settlement of New England, and have thence spread over the United States, especially in the Northern and Middle States. Their churches are independent of one another; their various ecclesiastical assemblies—councils, conferences, associations, associations—possess no ecclesiastical authority, but only a moral power; and they are generally moderate Calvinists in theological doctrines. Their missionary operations are carried on by means of voluntary societies supported by the churches, but only indirectly amenable to them.

congregationally (kong-grē-gā'shon-al-i), *adv.* In a congregational manner; by congregations; as a congregation.

2. The meeting of persons in sexual commerce.

—3. A formal meeting or association of persons having a representative character; an organization or authorized assemblage of persons for the consideration of some special subject or the promotion of some common interest; particularly, in politics, an assemblage of envoys, commissioners, or plenipotentiaries representing sovereign powers, or of sovereigns themselves, for the purpose of arranging international affairs; as, the *Congress of Vienna* (1814–15); the *Congress of Paris* (1856). For the distinction between conference and congress, see extract under *conference*, 2 (a).

As soon as the employers attempted to give work to subcontractors, they forced them by strikes to take it back. The society [of better] was called the *Congress*, was regulated by statutes, and framed bye-laws. All workmen of the trade belonged to it.

English Gilds (F. E. T. S.), Int., p. clxviii.

The congress of Aix la Chapelle, at which the five great powers were represented, . . . was intended to exercise a supervisory power over European affairs, interfering to prevent all dangerous revolutions, especially when they should proceed from popular movements.

4. [*cap.*] The national legislature of the United States. In *U. S. hist.* there have been three differently constituted bodies so named: (a) The *Continental Congress*, representing the thirteen colonies. What is known as the first Continental Congress, with delegates from all the colonies but Georgia, met in Philadelphia September 5th, 1774, and lasted until October 26th, 1774; the second, in which all were represented, met in Philadelphia May 10th, 1775, and adjourned December 12th, 1776; the third met in Baltimore December 20th, 1776, and lasted until the Articles of Confederation went into operation, March 1st, 1781. (b) The *Congress of the Confederation*, representing the States under the Articles of Confederation, March 1st, 1781, to March 4th, 1789. (c) The *Congress of the United States*, which represents both the States and the people under the Constitution, and which met for the first time March 4th, 1789. It consists of two houses, the Senate and House of Representatives (sometimes called the upper and lower houses), and meets at least once every year. The Senate is composed of two members from each State, elected (by its legislature) for a period of six years, one third of them being elected every second year. The number of representatives varies in each State in proportion to the population. (See *apportionment*, 2.) They sit for two years only. The united body, for the two years during which the representatives hold their seats, receives a numerical designation as a single Congress, counting from the first. Thus, the senators and representatives sitting during the period March 4th, 1886, to March 4th, 1897, constituted the 54th Congress. The most important powers of Congress, as enumerated in the Constitution, are: to impose and collect taxes, borrow and coin money, regulate commerce, establish uniform naturalization and bankruptcy laws, declare war, raise armies, maintain a navy, suspend the writ of *habeas corpus*, admit new States, and make all laws necessary to carry these powers into execution. In addition, the Senate confirms or rejects treaties, and nominations to office made by the President.

The substitution of "Congress" for "the legislature of the United States," requires no explanation. It is a mere change of phraseology.

Calhoun, Works, I, 266.

The upper house of Congress is therefore a federal while the lower is a national body, and the government is brought into direct contact with the people without endangering the equal rights of the several States.

J. Fiske, Amer. Pol. Ideas, p. 97.

5. The name of the lower house of the Spanish Cortes, and of the national legislatures of the South American republics.—**Church Congress**, a name applied to two voluntary organizations, one in the Church of England, the other in the Protestant Episcopal Church in the United States of America, for the free discussion of topics of church interest. Membership is confined to those who are in communion with the church. Neither body possesses any ecclesiastical authority or responsibility, or attempts any legislative functions. The same name, with modifying adjectives, as *inter-ecclesiastical Congress*, *inter-denominational Congress*, etc., has been applied to other bodies of a similar character embracing members of various Protestant communions.—**Congress boots**. See *boot*.—**Congress water**. See *mineral water*, under *mineral*.—**Peace Congress**, in *U. S. hist.*, a conference, in February, 1861, of delegates from free and border slave States, which made unsuccessful efforts to avert civil war by means of proposed amendments to the Constitution, dealing chiefly with slavery. Also called *Peace Convention* or *Conference*.—**Provincial congresses**, popular conventions which, at the beginning of the struggle between the American colonies and England, assumed control of the colonies.—**Stamp-Act Congress**, a body of delegates from nine colonies which met at New York, in 1765, to protest against the Stamp Act and other oppressive measures of the British Parliament.
